1 Playback control signals

IbaLogic 5.0.2 adds signals for controlling the playback module

When playback is enabled and a playback file (=ibaPDA-Dat-File) is configured, after **Apply** and **Signal Assignment** the following new signals are available:

Control signals (=Output):

Playback_Restart (Boolean, rising edge):

Restart the playback from the beginning of the file

Playback_Hold (Boolean):

TRUE = pause playback, all inputs stay at the last value, FALSE = continue playback

Status signal (=Input)

Playback_TimeInFile(analog, Real):

Time of the current playback sample (in seconds from the start of the file)
