1 Lines will be highlighted when selected

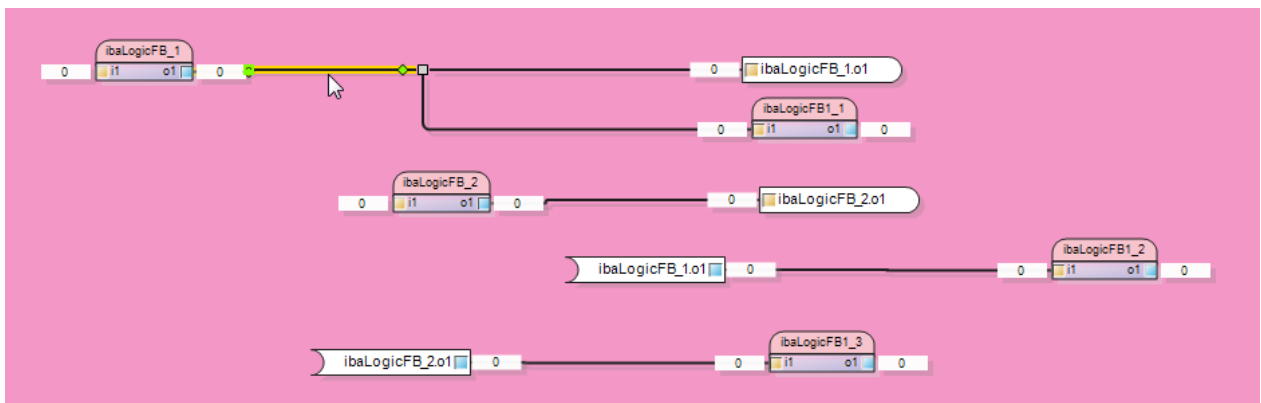

Selected connection lines will be highlighted (yellow background). This makes it easier to follow the line paths.

A single click on a line activates the highlighting to the next connecting point. This could be a line connector or any other connector.

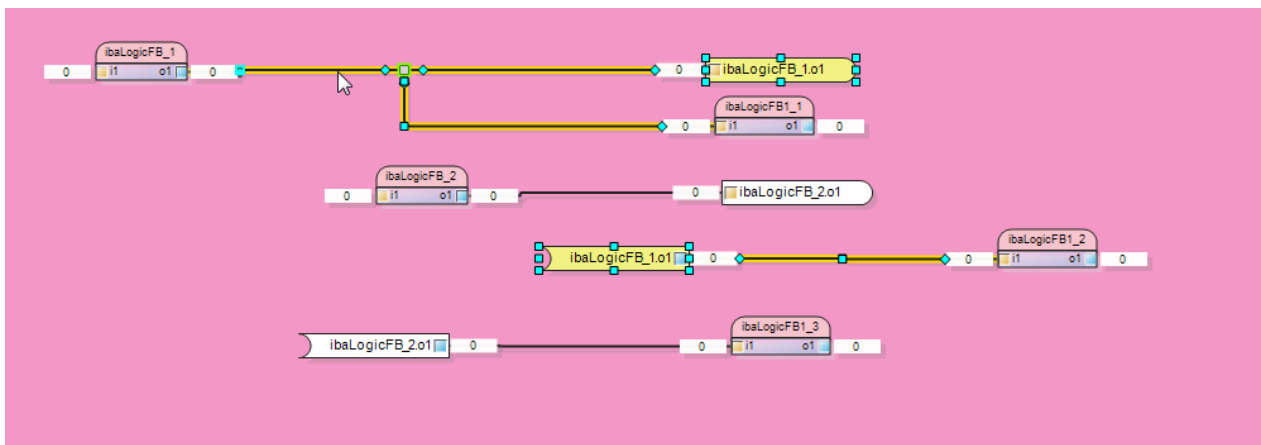

By pressing the ALT-Key, the whole line network including line connectors and IPCs (IntraPage connectors) will be highlighted.

Examples:

Single click on a line leads to a highlighting to the next connector point:

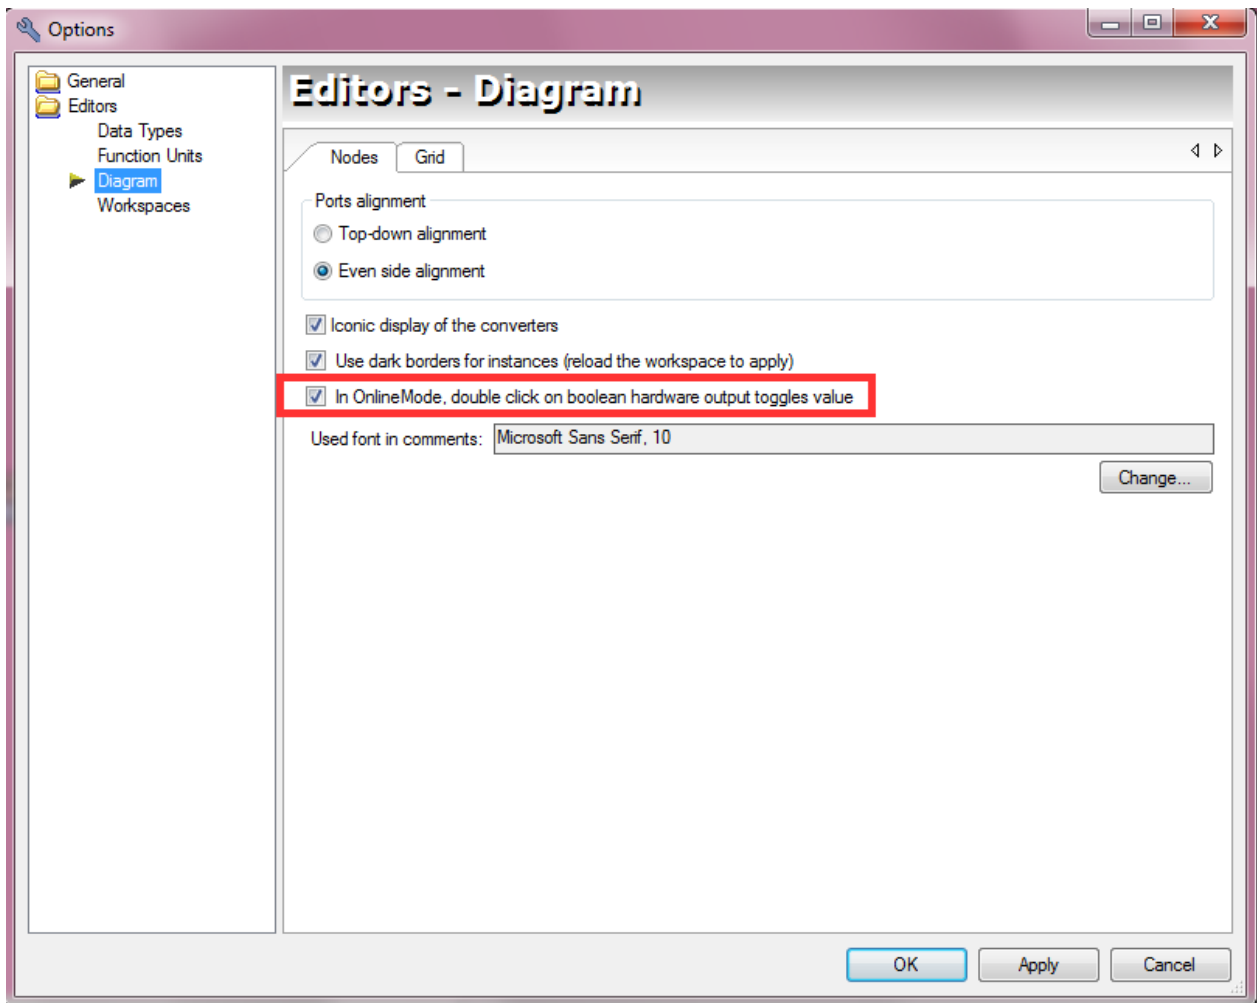

Click on the line with pressed ALT key leads to the highlighting of the whole line network

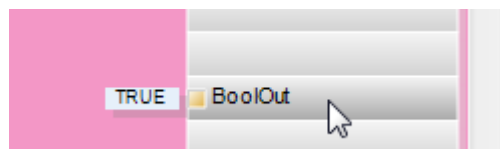

2 Unconnected boolean outputs can be toggled by doubleclick

A double click on an unconnected boolean output toggles its value.

This must be enabled in options:

Example: A double click in the connector field changes the value

Remarks: To change the default value of this boolean output in online mode the option must be disabled first.
