1 About this documentation

This documentation describes the function and application of the software *ibaManagementStudio*.

1.1 Target group and previous knowledge

This documentation is intended for IT administrators or other trained professionals who are responsible for the administration, distribution and installation of iba software in particular. A professional is someone who, on the basis of his/her technical training, knowledge and experience as well as knowledge of the relevant regulations, is able to assess the work assigned to him/her and identify potential hazards.

1.2 Notations

In this manual, the following notations are used:

Action	Notation
Menu command	Menu <i>Logic diagram</i>
Calling the menu command	<i>Step 1 – Step 2 – Step 3 – Step x</i> Example: Select the menu <i>Logic diagram – Add – New function block</i> .
Keys	<Key name> Example: <Alt>; <F1>
Press the keys simultaneously	<Key name> + <Key name> Example: <Alt> + <Ctrl>
Buttons	<Key name> Example: <OK>; <Cancel>
Filenames, paths	<i>Filename, Path</i> Example: <i>Test.docx</i>

1.3 Used symbols

If safety instructions or other notes are used in this manual, they mean:

Danger!

The non-observance of this safety information may result in an imminent risk of death or severe injury:

- Observe the specified measures.
-

Warning!

The non-observance of this safety information may result in a potential risk of death or severe injury!

- Observe the specified measures.
-

Caution!

The non-observance of this safety information may result in a potential risk of injury or material damage!

- Observe the specified measures
-

Note

A note specifies special requirements or actions to be observed.

Tip

Tip or example as a helpful note or insider tip to make the work a little bit easier.

Other documentation

Reference to additional documentation or further reading.

2 About ibaManagementStudio

ibaManagementStudio provides a central overview of all iba systems that are currently accessible via the local network or company-wide via VPN. This information can be accessed from any device with a web browser, such as a computer, tablet, or smartphone. All computers or iba edge devices on which at least one iba software product is installed are considered to be an iba system.

With the *ibaManagementStudio+* license, you can also update the iba software and licenses on the connected systems via the web client.

Collected information

The *ibaManagementStudio* server collects information about the installed iba software and iba edge devices as well as available licenses and firmware status via the connected agents. The collected information can then be viewed using a web browser.

The software information contains a list of installed iba software and its version as well as various status information, depending on the iba software. The license information contains the dongle number, the container type, the EUP date¹⁾ and the licensed iba software.

In addition to displaying the license information, you can download the information needed for license updates, e.g. as a JSON file or a VWR file.

You can group the different computers to create a better overview of their location (e.g. plant structure) or the logical context (e.g., all *ibaAnalyzer* computers, all quality-related *ibaPDA* computers).

2.1 System requirements

ibaManagementStudio Server

Hardware

- Computer: Multicore CPU 2 GHz, 4 GB RAM, 100 GB HDD (required disk space: 65 MB)

Software

- Operating system: Windows 10 (x64), Windows 11 (x64), Windows Server 2016 (x64), Windows Server 2019 (x64), Windows Server 2022 (x64)
- CodeMeter Runtime v7.40b or higher

Virtual machine

In a virtual environment, the use of iba software is possible via Ethernet-based interfaces (TCP/IP, UDP, etc.). The licenses are provided via a WIBU dongle or a WIBU soft license.

¹⁾ The "EUP date" is set with the purchase of a fee-based software license (purchase date + 2 years) and adjusted with each extension of the update period (maintenance contract). It determines the end of the period for free updates.

Internet connection

Only if you want to update WIBU licenses via the iba Gateway or use the iba Cloud installer repository, *ibaManagementStudio* server requires access to the internet. In addition, you must agree to the terms of use for internet access in *ibaManagementStudio* Server Status, see [↗ Settings in ibaManagementStudio Server Status](#), page 19.

ibaManagementStudio Agent**Hardware**

- no special hardware requirements
- required disk space: 110 MB

Software

- Operating system: Windows 10 (x86/x64), Windows 11 (x64), Windows Server 2016 (x64), Windows Server 2019 (x64), Windows Server 2022 (x64)

Supported iba software

You can view the diagnostic data for the following iba software products in *ibaManagementStudio* web client. As of *ibaManagementStudio* Agent v2.0.0, you can update these iba software products remotely with the *ibaManagementStudio+* license.

- *ibaPDA* server v8.1.1 or higher
- *ibaPDA* client v8.4.0 or higher
- *ibaHD-Server* v3.1.0 or higher
- *ibaCapture* v5.2.0 or higher, incl. *ibaCapture-ScreenCam*
- *ibaVision* v3.1.0 or higher
- *ibaAnalyzer*
- *ibaCMC Server*
- *ibaDatCoordinator*
- *ibaDaVIS*
- *ibaDongleViewer*
- *ibaLicenseService-V2*

2.2 License information

Only the server application of *ibaManagementStudio* requires a license. The agent applications and web clients do not require licenses.

Order no.	Name	Description
34.000200	ibaManagementStudio base license	Basic license with user management and overview over systems, installed software and licenses
34.000201	ibaManagementStudio+	License extension with the functions software update, license update and dashboard display

The server application of *ibaManagementStudio* uses WIBU CodeMeter licenses, either as a CmStick (USB) or a CmActLicense (soft license). A separate iba manual for management of WIBU CodeMeter licenses is available. You can find this in the download area of the iba website.

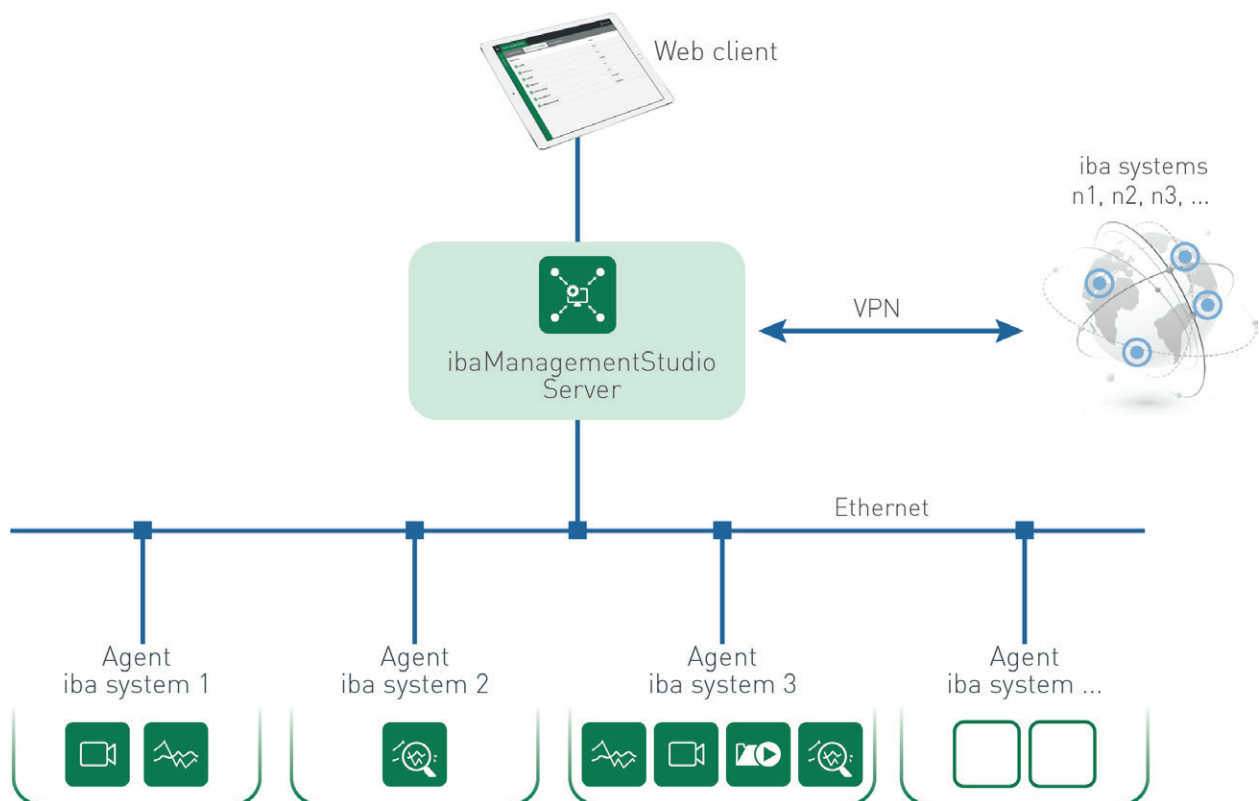

3 First steps

Here you can find information about the basic operating principle of *ibaManagementStudio* and its installation.

3.1 System structure

ibaManagementStudio consists of a server and one or more agents. The server is the central object that manages the connection to the different agents and prepares the collected information for the web client.

The web client can be accessed via any standard web browser, which can be on any device on the network, regardless of the platform. After successful login, the user receives the collected information about the different iba software products, depending on the configured access permissions. With the *ibaManagementStudio+* license, you can also update the iba software and licenses on the connected systems via the web client.

Connection between server and agents

The server and agents can communicate with each other via a LAN or WAN connection.

A LAN connection (server-initiated) is possible if the server and agent are in the same network. See also [➤ Connecting server-initiated via LAN](#), page 14.

A WAN connection (agent-initiated) is possible if the server and agent are connected via VPN, for example, and a firewall or router is connected between them. See also [➤ Connecting agent-initiated via WAN](#), page 15.

3.2 Installing the server

To set up *ibaManagementStudio*, you need a server with which the agents can communicate. For this purpose, install the software for the *ibaManagementStudio* server.

1. Execute the [ibaManagementStudio_Server_Setup_v2.x.y.exe](#) file, e.g., by double-clicking on the filename in Windows Explorer. Follow the instructions of the installation wizard.
2. If necessary, select the language for the installation process.
3. Accept the license agreement.
4. Select whether *ibaManagementStudio* creates a desktop shortcut to the web client.
5. Select the installation folder.
6. Select the user account (optional).
 - Local system account (default):
The local system account has administrator rights for the local computer.
 - This account:
Select this option if you want to run the server with a special user account or Group Managed Service Account (gMSA).

Further information on creating and using service accounts can be found in the "IT security guide". You can find the guide in the download area on the iba website or in the help center at <https://docs.iba-ag.com>.
7. Start the installation process with <Install>.
8. Finish the installation with <Finish>.

Make sure that you have enabled or installed the corresponding WIBU license either as a CmStick (USB) or a CmActLicense (soft license) to ensure that the *ibaManagementStudio* server application functions correctly. A separate manual for management of WIBU CodeMeter licenses is available from iba. You can find this documentation in the download area on the iba website or in the help center at <https://docs.iba-ag.com>.

Afterwards, you can configure additional settings for the server in *ibaManagementStudio* Server Status, see ↗ *ibaManagementStudio* Status, page 17. You can then add the agents in the web client, see ↗ *Adding a system*, page 39.

3.3 Installing agents

To set up *ibaManagementStudio* you need agents that can communicate with the server. To do this, install the software for the *ibaManagementStudio* Agent on a computer on which iba software products are installed.

1. Execute the [ibaManagementStudio_Agent_Setup_v2.x.y.exe](#) file, e.g., by double-clicking on the filename in Windows Explorer. Follow the instructions of the installation wizard.
2. If necessary, select the language for the installation process.
3. Accept the license agreement.
4. Select the installation folder.
5. Select the user account (optional).
 - Local system account (default):
The local system account has administrator rights for the local computer.
 - This account:
Select this option if you want to run the agent with a special user account or Group Managed Service Account (gMSA).

Further information on creating and using service accounts can be found in the "IT security guide". You can find the guide in the download area on the iba website or in the help center at <https://docs.iba-ag.com>.
6. Select the communication mode between the server and agent:
 - LAN mode, see [➤ Connecting server-initiated via LAN](#), page 14.
If you have selected LAN mode, you can optionally select a TLS certificate in the next step.
 - WAN mode, see [➤ Connecting agent-initiated via WAN](#), page 15.
If you have selected WAN mode, specify the server's IP address and port number.
7. Start the installation process with <Install>.
8. Finish the installation with <Finish>.

Afterwards, you can configure additional settings for the agent in *ibaManagementStudio* Agent Status, see [➤ ibaManagementStudio Status](#), page 17. You can then add the agents in the web client, see [➤ Adding a system](#), page 39.

Note

In order for the web client to display supported iba software products, you have to restart the respective software services after installation. This is the only way the software can connect to the *ibaManagementStudio* Agent.

3.4 Configuration concept

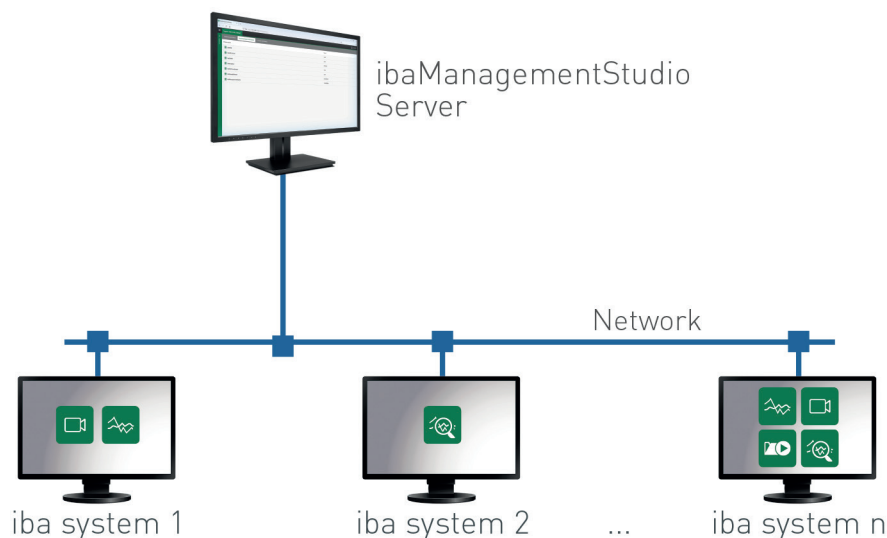

Configure *ibaManagementStudio* in the following order:

1. Install software for the server application and set up the server, see [🔗 Installing the server](#), page 12.
2. Install software for the agent applications and set up the agents, see [🔗 Installing agents](#), page 13.
3. Connect agents to the server via the web client, see [🔗 Adding a system](#), page 39.

3.4.1 Connecting server-initiated via LAN

The individual iba systems can be connected and communicate with the server as agents via LAN. The server initiates the connection to the agent.

Prerequisite: The server and agents are located in the same network.

Setting up a server-initiated LAN connection

You can set up the server-initiated LAN connection as follows.

1. When installing the *ibaManagementStudio* Agent application, select LAN mode, see [🔗 Installing agents](#), page 13.
2. In *ibaManagementStudio* Agent Status, select LAN mode under *Connection mode* in the *Settings* tab, see [🔗 LAN connection settings](#), page 22.

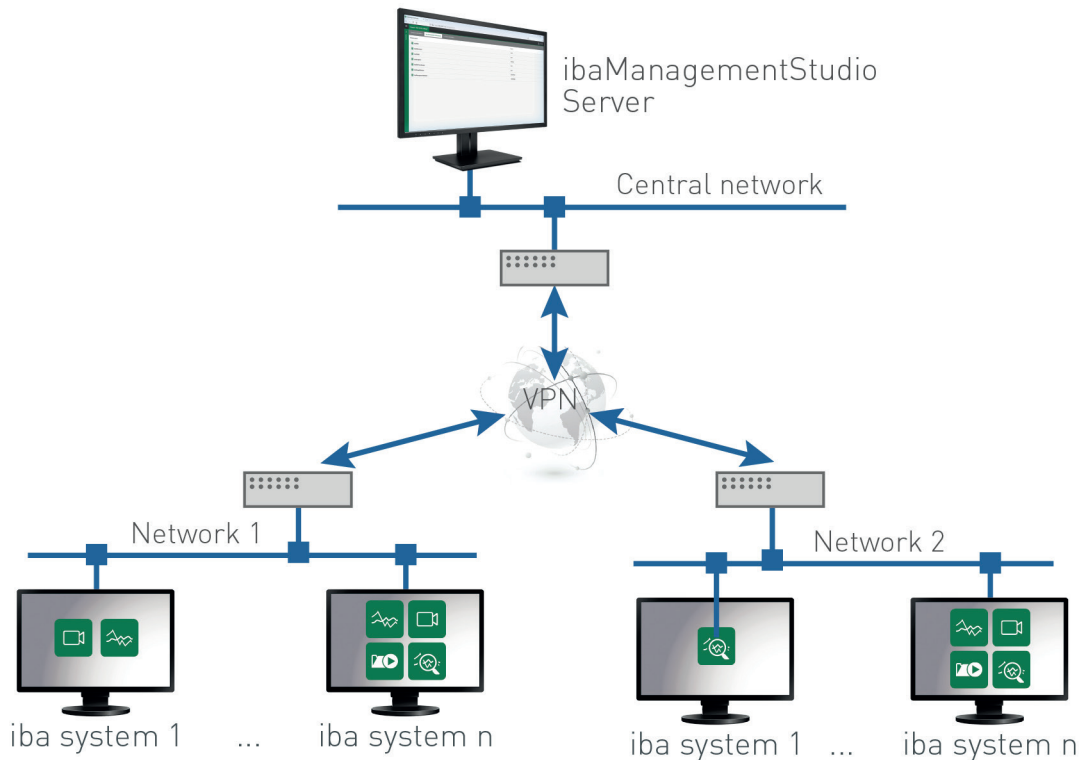

Enter the connection data and, optionally, assign a password that is at least 8 characters long.

3. In the web client, add the agents in the LAN network and connect the agents to the server under *Settings – Systems configuration*, see [🔗 Adding a system](#), page 39.

3.4.2 Connecting agent-initiated via WAN

The individual iba systems can be connected and communicate with the server as agents via WAN. This means that, for example, a router or firewall is connected between the server and agent. The agent actively searches for the server and initiates the connection.

Prerequisite: The server address is known.

Setting up an agent-initiated WAN connection

You can set up the agent-initiated WAN connection as follows.

1. When installing the *ibaManagementStudio* Agent application, select WAN mode, see [↗ Installing agents](#), page 13.
2. In *ibaManagementStudio* Agent Status, select WAN mode under *Connection mode* in the *Settings* tab and enter the connection data, see [↗ WAN connection settings](#), page 22.
3. In the web client, add the agents as WAN systems and connect the agents to the server under *Settings – Systems configuration*, see [↗ Adding a system](#), page 39.

3.4.3 Adding new systems

In the web client, you can add new systems under *Settings – Systems configuration* in the *Systems* tab. You can only add systems on which you have installed the *ibaManagementStudio* Agent application.

For a detailed description of how to add systems, see [➤ Adding a system](#), page 39.

3.4.4 Retrieving information about systems and updating software

The following information can be found in the *ibaManagementStudio* web client.

- Information about the systems that are connected to the *ibaManagementStudio* server.
- Information about the iba software products installed on the connected systems and update possibility of supported iba software products.
- Information about the licenses used on the connected systems.
- With *ibaManagementStudio+* license:
 - Remote update of the iba software on connected systems
 - License updates on connected systems

For more details, see [➤ Systems overview](#), page 26 and [➤ Managing iba software in the web client](#), page 43.

4 ibaManagementStudio Status

After installation of *ibaManagementStudio* you can find a status icon for *ibaManagementStudio* Status in the taskbar. Depending on the installation, *ibaManagementStudio* Status is assigned to either the server application or the agent application.

ibaManagementStudio Status for the server application or the agent application has the following functions:

- View and change the status of the server or agent
- Change settings for server or agents
- Show logs
- Generate data for support case

The different icons indicate the following states for the respective applications.

<i>ibaManagementStudio</i> Status ...	general	service running	service stopped	not connected
Agent application				
Server application				

Opening ibaManagementStudio Status

You can start the application in several ways:

- Double-click the *ibaManagementStudio* Status icon in the taskbar
- Right-click the *ibaManagementStudio* Status icon in the taskbar and select *Open* in the context menu
- Via the Windows Start menu: *All programs – ibaManagementStudio* [Server/Agent] – *ibaManagementStudio* [Server/Agent] Status

Displaying and changing the status

You can view and change the status in several ways:

- You can read the status via the *ibaManagementStudio* Status icon in the taskbar.
Changing the status: Right-click the status icon to stop, start and restart the service in the context menu via the *Start service*, *Stop service* and *Restart service* entries.
- If *ibaManagementStudio* Status is open, you can check the status of the server/agent in the *General* tab and start, stop and restart it via the buttons.
Changing the status: Use the <Start>, <Stop> and <Restart> buttons to stop, start and restart the service.

If the option *Auto-start when Windows starts* is enabled, *ibaManagementStudio* Status starts automatically at Windows login and runs in the background.

Connection status of the agent application to ibaManagementStudio server

In the agent application, you can view the connection status of the agent to the server. In addition to the IP address of the server, you can also find the time when the connection was established or when the last connection was established.

Setting the language of the status application

By default, *ibaManagementStudio* Status is displayed in the language of your operating system. You can also display the status application in other languages via the *Language* drop-down menu.

If you change the language without restarting the service, only the language of the user interface changes but not the language of the messages and notifications.

Viewing logs

If *ibaManagementStudio* Status is open, you can view the logs of all events in the *Log* tab.

- To open the folder with all log files, click <Open log directory>.
- To open the current log file, click <Open log file>.

The log files are located in the following directory:

`C:\ProgramData\iba\ibaManagementStudio\[Server/Agent]\Log`

You can also access the log files folder from the Start menu:

Start – ibaManagementStudio – ibaManagementStudio [Server/Agent] Log Files

Displaying license information

ibaManagementStudio Server Status shows the license information for the *ibaManagementStudio* Server application in the *General* tab. The agent application does not require a license.

ibaManagementStudio services

ibaManagementStudio runs as a service under Windows. In addition to the agent service, an auxiliary service must also be running to perform tasks that require elevated permissions. This means that the agent service, which does not have an open interface, does not require elevated permissions.

The auxiliary service does not open any additional ports, but uses the interaction port of the software.

4.1 Settings in ibaManagementStudio Server Status

If *ibaManagementStudio* Server Status is open, you can configure the web client and WAN communication in the *Settings* tab.

No additional settings are available for LAN communication in *ibaManagementStudio* Server Status.

To save your settings, click on <Apply settings>.

Settings for software and license update

- **File repository:** Enter the directory where *ibaManagementStudio* Server stores the installer files for iba software updates, see [Update files and file repository](#), page 43. The default directory is:
`C:\ProgramData\iba\ibaManagementStudio\Server\Storage\Persisted`
- **MARX license updates:** Enter the directory in which you store the license update files for the MARX dongle, see [Updating MARX licenses](#), page 52. The default directory is:
`C:\ProgramData\iba\ibaManagementStudio\Server\Storage\MarxUpdates`

- **Repository synchronization mode:** Select the method you want to use to synchronize the file repository: For more information, see [Synchronization of the repository](#), page 24.
 - *iba Cloud Installer repository:* Synchronization takes place via the iba cloud.
 - *Local import folder:* Synchronization takes place via the import folder of the installer files, which you set here.
 - *None:* The directory is not synchronized automatically. You must then upload the installer files manually via the web client under *Repository*.
- **Installer import folder:** Enter a directory from which installation files can be copied to the file repository. This can, for example, be the directory of the supplied data medium that contains the installer files for the iba software. The default directory is:
`C:\ProgramData\iba\ibaManagementStudio\Server\Storage\Import`
- **Accept the terms of use for internet access:** If you want to update WIBU licenses via the iba gateway or use the iba Cloud Installer repository, *ibaManagementStudio* Server requires access to the Internet. To do this, you must agree to the terms of use and activate the option.

If you deactivate this option later, *ibaManagementStudio* Server can no longer communicate with the iba WIBU gateway and the iba Cloud Installer repository. You will then no longer be able to use these functions.

To accept or revoke the terms of use, you must run *ibaManagementStudio* Server Status as administrator.

Settings for the web client or WAN connection

- **Listening interface:** Configure the interface for the corresponding connection.
- **Listening port:** Configure the port number for the corresponding connection.
- **TLS certificate:** Configure the certificate for the corresponding connection.

The default certificate was generated during installation of *ibaManagementStudio*. If you use a certificate other than the default certificate, you must specify additional settings.

4.2 Settings in ibaManagementStudio Agent Status

When *ibaManagementStudio* Agent Status is open, you can configure settings for your device, LAN mode or WAN mode when communicating with the server in the *Settings* tab.

To save your settings, click on <Apply settings>.

The screenshot shows the 'Settings' tab of the 'ibaManagementStudio agent status' window. The window has a title bar with standard OS controls and a menu bar with 'General', 'Settings', 'Log', and 'Updates'. The 'Settings' tab is active, showing a 'Settings' section with the following fields:

- Software interaction port:** A numeric input field set to 10521.
- Communication mode:** Two radio buttons: 'Server-initiated' (selected) and 'Agent-initiated'.
- Server-initiated communication:**
 - Listening interface:** A dropdown menu set to 'All interfaces'.
 - Listening port:** A numeric input field set to 10518.
 - Access password:** A text input field with masked characters (dots).
 - TLS certificate:** A dropdown menu set to 'Default certificate'.
 - Certificate path:** A text input field with a file explorer icon to its right.
 - Certificate password:** A text input field.
 - Issued to:** A text input field.
 - Certificate store:** A dropdown menu set to 'Personal'.
 - Store location:** A dropdown menu set to 'Current user'.
- Agent-initiated communication:**
 - Server address:** A text input field set to 192.168.123.180.
 - Server port:** A numeric input field set to 10522.

At the bottom left of the settings area is a button labeled 'Apply settings'.

Settings for your device

- **Software interaction port:** Via this port, *ibaManagementStudio* communicates with the different iba software products.

If you change this port number, you have to restart the software services. This is the only way the software can connect to the *ibaManagementStudio* Agent.

- **Connection mode:** Select the communication mode with the server. Specify additional settings for your selected communication mode.

LAN connection settings

- **Listening interface:** Configure the interface for connection to the server.
- **Listening port:** Set the port number for connection to the server.
- **Access password:** Optionally, set the access password for connection via the web client. This way you can protect the connection to the agent so that other servers cannot connect to the agent.

The password must be at least 8 characters long.

- **TLS certificate:** Configure the certificate for connection to the server.

The default certificate was generated during installation of *ibaManagementStudio*. If you use a certificate other than the default certificate, you must specify additional settings.

WAN connection settings

- **Server address:** Set the IP address of the *ibaManagementStudio* server.
- **Server port:** Set the port number for the *ibaManagementStudio* server.

4.3 Updates via ibaManagementStudio Agent Status

If new updates for iba software products are available in the file repository, the *ibaManagementStudio* server also informs the agents, see ↗ *Update files and file repository*, page 43. In the *ibaManagementStudio* Agent Status in the *Updates* tab, you can also perform these updates locally.

Unlike the updates via the web client, updates via *ibaManagementStudio* Agent Status are also possible if no permission for remote actions is granted for the system in the web client, see ↗ *Editing systems*, page 40.

Procedure in ibaManagementStudio Agent Status in the Updates tab

1. Download the installer file of the desired iba software product by clicking on <Download>.
 - The installation file is downloaded from the *ibaManagementStudio* server to your local computer.
2. Open the local folder where the installation file is located via <Browse>.
3. Install the software update with the new installer file.

4.4 Data for support cases

For support cases, you can create a ZIP file in which all relevant settings and configurations of the *ibaManagementStudio* server and agent are saved. You can send this ZIP file to iba support for troubleshooting assistance.

You can generate data for iba support in various places.

Data for	Where to generate	Related link
<i>ibaManagementStudio</i> Agent	<i>ibaManagementStudio</i> Agent Status, local on system	see below
	in the web client under <i>Systems</i> and selection of a system, <i>General information</i> tab	➤ <i>General information about connected systems</i> , page 29
<i>ibaManagementStudio</i> Server	<i>ibaManagementStudio</i> Server Status, local on system	see below
	in the web client under <i>Settings – Server configuration</i>	➤ <i>Downloading a support file for server</i> , page 50
complete iba software on connected system	in the web client under <i>Systems</i> and selection of a system, <i>iba SW product</i> tab	➤ <i>Information about iba software products on system level</i> , page 30
specific iba software on connected system	in the web client under <i>Systems</i> and selection of a system and specific software, <i>General</i> tab	➤ <i>Software diagnostics in the web client</i> , page 49

Creating a ZIP file for support locally

1. On the system that has generated the error, open the context menu of *ibaManagementStudio* Status by right-clicking the status icon.
 2. Select *Help – Save information for iba support*.
 3. Select a storage location.
- The ZIP file for iba support is then be created.

Send the ZIP file to iba support, see ➤ *Support and contact*, page 74.

Backup files

For support purposes, *ibaManagementStudio* creates backup files for each system configuration. The backup files are located in the following directory:

C:\ProgramData\iba\ibaManagementStudio\Server\Backup

4.5 Synchronization of the repository

The repository is a local storage directory on the computer on which *ibaManagementStudio* Server is running. This storage directory is intended for installer files of iba software, which you can then install on the connected systems via the web client.

In the settings in *ibaManagementStudio* Server Status, you can set the synchronization mode for this repository as well as the storage location, see [➤ Settings in ibaManagementStudio Server Status](#), page 19. The selected synchronization mode is also visible in the web client in the main menu under *Repository*. Synchronization always takes place in the background.

No synchronization

In the mode *None*, the repository is not synchronized automatically. This means that *ibaManagementStudio* does not check the iba Cloud or the import folder to see if there are any new installer files.

If you add new installer files via the web client in the main menu under *Repository*, *ibaManagementStudio* recognizes these new files. *ibaManagementStudio* also recognizes manually added installer files if you observe the correct folder structure in the storage location of the repository.

Local import folder

If you select this mode, specify a directory from which *ibaManagementStudio* can copy installer files to the *File repository* directory. This can, for example, be the directory of the supplied data medium that contains the installer files for the iba software.

ibaManagementStudio then regularly checks whether new installer files are available in this directory and then copies them to the repository folder.

iba Cloud Installer repository

ibaManagementStudio offers a Cloud service in which iba AG provides the latest installer files in a cloud. If you select the *iba Cloud installation directory* mode, *ibaManagementStudio* checks daily whether new installer files are available there and then loads them into the repository folder.

ibaManagementStudio only downloads the latest installer files of the iba software that is installed on the connected systems.

In the web client in the main menu under *Action history*, you can see when *ibaManagementStudio* with the username *ibaMgS* has downloaded which installer file.

An internet connection is required for this function and you must agree to the terms of use, see [➤ Settings in ibaManagementStudio Server Status](#), page 19.

Other documentation

Further information on important settings regarding the internet connection of *ibaManagementStudio* can be found in the "IT security guide". You can find the guide in the download area on the iba website or in the help center at <https://docs.iba-ag.com>.

5 ibaManagementStudio web client

ibaManagementStudio provides you with a configuration and user interface for your web browser. To ensure that you can display all formats and features correctly, the use of a modern web browser is recommended, such as Google Chrome, Mozilla Firefox or Microsoft Edge.

5.1 Logging in to the web client

To reach the *ibaManagementStudio* server, you need the server's IP address. If you are logged in to the computer where the server application is installed, the localhost address is sufficient.

The default port number for the *ibaManagementStudio* server is 10522. If this is already reserved, another port number can be used. You set this port number in *ibaManagementStudio* Server Status.

1. Open `https://localhost:10522` or `https://[IP address]:[PortNo]` in your browser.
2. Log in for initial registration with the following credentials.

User name	Admin
Password	Admin#1

Note

We recommend changing the initial password after installation, see [↗ Changing the password](#), page 70. Doing so makes unauthorized use of the system more difficult.

5.2 Systems overview

In the main menu under *Systems*, you find an overview of all systems on which *ibaManagementStudio* is installed and which are connected to the server.

Name	Updates	Status	Connection mode	Host	Port	ibaManagementStudio Agent version
VM Test System		Online	Agent-initiated	192.168.80.42	10518	2.1.0
MyComputer01	4	Online	Server-initiated	192.168.82.242	55610	2.0.3

The status of individual systems as well as the grouped systems is shown. When systems are offline, the systems and their folders are highlighted in the overview. Empty folders or folders that are not visible to the user due to insufficient access permissions are not displayed. *ibaManagementStudio* regularly updates the information displayed.

The blue notification icons behind the system names show if and how many updates are available for the system.

Using the gear button above the table, you can show and hide columns. You can change the order of the columns using drag & drop in the table header. These changes are saved only for the current user and the browser used.

You can download an overview of all connected systems as a CSV file or JSON file using the <Download system overview> button.

Via the <Download all license information> button you can generate and download a ZIP file, in which the license information of all systems in the selected folder is saved. The ZIP file additionally contains a CSV file, in which the license information of the individual systems is stored as text.

If you select an individual system, you will find even more information about the respective systems and the installed iba software products.

Display variants of folders and systems

green	All systems are connected.
orange	System is connected, but an iba-software product is stopped.
red	System is not connected.

The folders already show the status of the subordinate systems.

Folder content view as table

The table view is the default view for the folder content. You can find the following information here:

Name	Name of the connected agent
Updates	Number of available software and license updates
Status	Status of the system (online, offline)
Connection mode	Connection mode of server and agent
Host	Agent host address
Port	Agent port number
<i>ibaManagementStudio</i> Agent version	installed agent version
Description	Description of the system as specified in the main menu item <i>Settings – Systems configuration</i> (by default initially hidden)

Folder content view as dashboard

Note

This function is only available with the *ibaManagementStudio+* license.

If you click the <Switch to dashboard view> button, you see the folder contents as a dashboard. This view not only contains more information than the table view, but also live data on the hardware of the systems.

The table shows the following information:

Name	Name of the connected agent
EUP date	Next expiring or expired EUP date
Licenses	Number of license containers used on the system
License time limit	Date of next expiring or expired license
Software updates	Number of available software updates
License updates	Number of available license updates
CPU	Current CPU usage of the system

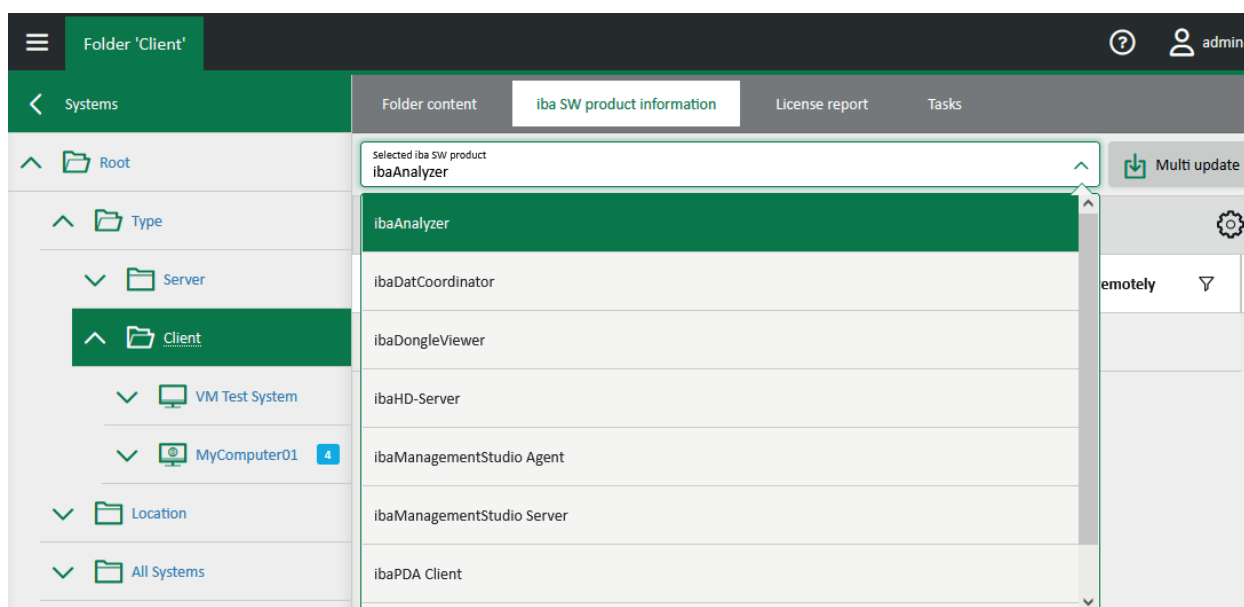

RAM	Current RAM usage of the system
Description	Description of the system as specified in the main menu item <i>Settings – Systems configuration</i>
Connection mode	Connection mode of server and agent
Host	Agent host address
Port	Agent port number
<i>ibaManagementStudio</i> Agent version	installed agent version

You can sort the table in ascending or descending order by clicking on a column header.

Using the filter button, you can filter the table entries.

5.3 Information about iba software products on folder level

If you select a folder in the overview under *Systems* in the main menu, in the *iba SW product information* tab you can see a drop-down list with the iba software products installed on the systems in the selected folder.

You can sort the table in ascending or descending order by clicking on a column header.

Using the filter button, you can filter the table entries.

If you select an iba software product, you can see the systems using this software and the respective software version from the product view.

If an update is available for an iba software product, the web client displays the <Update> button and the available software version.

Using the button <Update multiple>, you can update the selected iba software product on multiple systems in this folder.

For more information on the remote software update, see [Updating iba software products via the web client](#), page 45.

5.4 General information about connected systems

If you select an individual system in the overview under *Systems* in the main menu, in the *General information* tab you can view general information about the system. This includes, for example, the name of the system, the host address and the status of the system.

The screenshot displays the 'General information' tab for a system named 'MyComputer01'. The left sidebar shows a tree view with categories like Root, Type, Server, Client, VM Test System, and MyComputer01 (selected). The main content area is divided into two sections: 'System information' and 'Action history'.

System information:

- Alias: MyComputer01
- Description: This is my notebook
- Host name: MyComputer01
- Connection mode: Agent-initiated
- Host: 192.168.82.242
- Port: 55610
- Status: Online
- Version: 2.2.0

Action history:

User	Start timestamp	End timestamp	Action
admin	3/14/2025 8:22:12 AM	3/14/2025 8:23:10 AM	Successful SW update (file: ibaMa

For support cases, you can use the button <Download ibaManagementStudio Agent support file> to generate and download a ZIP file in which all relevant settings and configurations for *ibaManagementStudio* Agent are saved. You can send this ZIP file to iba support for troubleshooting assistance, see [Support and contact](#), page 74.

If you have the respective permissions, the Action history for this system is also available, see also [Information about the Action history](#), page 36.

If the system is offline, an additional orange bar appears including the time of the last data update. In offline mode, you only see the last information that the *ibaManagementStudio* server could retrieve from the system. The hardware information is not available.

5.5 Information about iba software products on system level

If you select an individual system in the overview under *Systems* in the main menu, in the *iba SW product information* tab you can see an overview of the iba software products installed on the selected system, their version and possible updates from the system view.

Product name	Software components	Version	Available update	Update remotely
ibaAnalyzer		8.2.3	8.3.1	Update
ibaDatCoordinator		3.1.3	3.1.4	Update
ibaHD-Server		3.4.2	3.5.0	Update
ibaManagementStudio		2.2.0		
ibaPDA Client		2.2.0		
ibaPDA Server	ibaPDA Client ibaPDA Server	8.10.0		

You can sort the table in ascending or descending order by clicking on a column header.

Using the filter button, you can filter the table entries.

For support cases, you can use the button <Download product support files> to generate and download a ZIP file, in which the support files of the selected iba software products on the selected system are saved. You can send this ZIP file to iba support for troubleshooting assistance, see [Support and contact](#), page 74.

Using the <Update multiple products> button, you can update multiple iba software products on the system, see [Updating multiple iba software products](#), page 47.

If the system is offline, an additional orange bar appears including the time of the last data update. In offline mode, you only see the last information that the *ibaManagementStudio* server could retrieve from the system. You cannot create support files.

Using the gear button above the table, you can show and hide columns. You can change the order of the columns using drag & drop in the table header. These changes are saved only for the current user and the browser used.

Information about iba software products

Green icon	Software is supported, the service is running and diagnostic data is available.
Orange icon	Software is supported but the service is stopped.
Black icon	Software is supported but diagnostic data is not available.
Black box	Software is not supported yet.

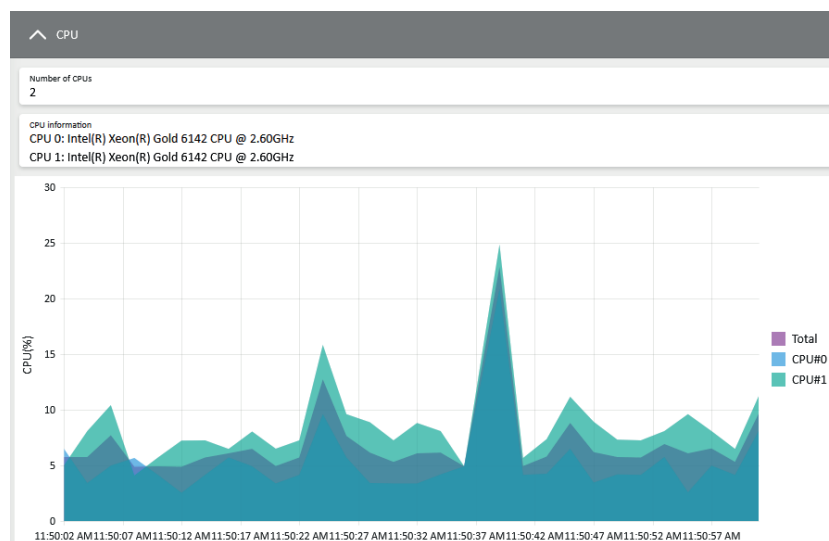

For supported iba software, you can find more information as well as diagnostic data on the individual software pages, see [Software diagnostics in the web client](#), page 49.

5.6 Information about the hardware in use

If you select an individual system in the overview under *Systems* in the main menu, you can view all relevant hardware information for the selected system in the *Hardware information* tab. In addition to general information such as manufacturer and operating system, you can also find live data such as CPU utilization or network utilization.

If the system is offline, the hardware information is not available.

The screenshot displays the 'Hardware information' tab for a system named 'MyComputer01'. The left sidebar shows a tree view with 'MyComputer01' selected. The main content area is divided into two sections: 'General' and 'OS'. The 'General' section includes fields for Manufacturer (LENOVO), Current time (6/30/2025 3:11:56 PM), and PC name (MyComputer01). The 'OS' section includes fields for OS language (English (United States)), OS version (Microsoft Windows NT 10.0.1439.0 (x64)), OS name (Microsoft Windows 10 Enterprise 2016 LTSB), Workgroup (WORKGROUP), and Role (Standalone Workstation (0)).

5.7 License information

If you select an individual system in the overview via *Systems* in the main menu, you can view the license information for the selected license type in the *License information* tab. The available information differs depending on the license type. If license updates are available, the licenses are marked.

You can download all information about the various license types via the <Download> button. The selection of the respective file formats depends on the license type. Using the <All license information> entry, you can download the information for each license type in each file format simultaneously.

Select the desired license container under *Available license containers*.

The screenshot shows the 'License information' tab for system 'MyComputer01'. The interface includes a sidebar with a tree view of system components (Root, Type, Server, Client, VM Test System, MyComputer01, ibahd-Server, ibapda Client, ibapda Server, Location, All Systems). The main area displays the 'License information' tab with a 'Download...' button and a status bar indicating 'iba WIBU gateway: Online' and 'Last check: 3/24/2025 2:10:23 PM'.

Under 'Available license containers', there is a table with columns: Show details, License container, Type, and Update remotely. The table lists two containers: '130-1234567890' (WIBU) and 'V123456' (MARX). The WIBU container is selected and has an 'Update' button.

Below the table, there are sections for 'CodeMeter Runtime' (Version 8.10.6237), 'Container information' (Container ID 130-1234567890, Customer iba Intern, Container type WIBU CmActLicense v3.0, Container host MyComputer01), and 'EUP dates'.

The 'EUP dates' section contains a table with columns: Product, EUP date, and Spare hours. The table lists various products and their corresponding EUP dates and spare hours.

Product	EUP date	Spare hours
ibaManagem...	None	None
ibaPDA Server	None	None

You can sort the table in ascending or descending order by clicking on a column header.

Using the filter button, you can filter the table entries.

License information for the WIBU license container

If you select a WIBU license container, you see the following information about the licenses running via the selected license container:

- **CodeMeter Runtime:** Version of the license software
- **Container information:** Information about the WIBU license container
- **EUP dates:** Period in which you receive updates for the corresponding software

- *License options*: Available licenses
- *Linked tickets*: Tickets that are associated with this system

You can download the license information as a JSON file or WIBU container receipt using the <Download> button.

For information about the WIBU license update, see ➤ *Updating WIBU licenses*, page 54.

License information for the MARX license container

If you select a MARX license container, you see the following information about the licenses running via the selected license container:

- *Container information*: Information about the MARX license container
- *Passwords in use*: Software with user management enabled
- *EUP dates*: Period in which you receive updates for the corresponding software
- *License options*: Available licenses

You can download the license information as a JSON file or VWR container receipt using the <Download> button.

For information about the MARX license update, see ➤ *Updating MARX licenses*, page 52.

5.8 License report on folder level

Note

This function is only available with the *ibaManagementStudio+* license.

If you select a folder in the overview under *Systems* in the main menu, in the *License report* tab you can see an overview of all licenses used on the systems in this folder.

License	License time limit	Quantity	Demo license
License container: 130-1234567892 (VM Test System - WIBU)			
License container: 130-1234567890 (MyComputer01 - WIBU)			
ibaPDA	12/31/2026		✓
ibaPDA signals	12/31/2026	4096	✓
ibaPDA data stores	12/31/2026	2	✓
ibaPDA client connect...	12/31/2026	1	✓

You can group the display in different ways:

- Group by license container (default): All product licenses that belong to the same license container are displayed in the same group.
- Group by licenses: All license containers that contain the same product license are displayed in the same group.

To get an overview of your licenses, you can use the <Export to Excel> button to download an Excel spreadsheet with the displayed license information according to the current grouping. The latest available information from disconnected systems is also included in this table. These entries are marked with an asterisk (*) because the information is not up-to-date.

You can sort the table in ascending or descending order by clicking on a column header.

Using the filter button, you can filter the table entries.

The table shows the following information:

License location	System name, license container and license type to uniquely identify the license container
License	Name of the license
License time limit	Expiration date of the license
Quantity	Number of licenses
Demo	Shows whether this license is a demo license

5.9 Information about alarms

Note

This function is only available with the *ibaManagementStudio+* license.

In the main menu under *Alarm*, you find an overview of all connected systems that are offline or for which there is a warning message, e.g. if a software service is stopped. This view is based on the dashboard view of the system overview, see [Folder content view as dashboard](#), page 27.

If you move the mouse over a system or a cell, a tooltip shows more information about the system status or the cell entry. If you click on a system or a cell, the respective view opens.

The screenshot displays the 'Alarm' section of the ibManagementStudio web client. It features two main tables. The first table, 'Offline systems', lists systems that are offline or have warnings. It includes columns for system name, EUP date, license details, and update counts. The second table, 'System warnings', provides a detailed view of system health, including CPU and RAM usage percentages. Both tables include pagination and sorting options.

ibaManagementStudio updates this view regularly. If the status of a system changes, e.g. when the computer is started up, the entry may jump to the other table or disappear.

You can sort the table in ascending or descending order by clicking on a column header.

Using the filter button, you can filter the table entries.

5.10 Information about the Action history

Note

This function is only available with the *ibaManagementStudio+* license.

In the main menu under *Action history*, you find an overview of the last 300 actions carried out via the web client. Actions include updates to licenses and software as well as adding or deleting installer files.

To view the Action history in the web client, you need the *Manage settings* permission and the permission to view the respective system in the *ibaManagementStudio* user administration.

Only an administrator user can view the *User* column in the action history.

Action history					
System	User	Start timestamp	End timestamp	Action	
MyComputer01	ibaMgS	3/13/2025 7:34:49 AM	3/13/2025 7:34:49 AM	ibaCapture-ScreenCam: 5.1.0 (ibaCaptureScreenCamSetup	
VM Test System	admin	3/12/2025 12:20:42 PM	3/12/2025 12:20:43 PM	Successful WIBU Auto-Update (130-1234567890)	
VM Test System	admin	3/11/2025 1:48:23 PM	3/11/2025 1:48:26 PM	Adding installer from D:\Repository\Installers\ibaManagerr	

You can sort the table in ascending or descending order by clicking on a column header.

Using the filter button, you can filter the table entries.

The table shows the following information:

System	System on which the action was executed
User	User who performed the action
Start timestamp	Start time of the action
End timestamp	End time of the action
Action	Success and type of update

5.11 Information on current tasks

If you select an individual system or a folder in the overview under *Systems* in the main menu, in the *Tasks* tab you can see an overview of the status of all tasks that you have started in the web client and that have not yet been completed. The notification at the tab name indicates the number of running tasks.

General information iba SW product information 5 Hardware information License information Tasks 4			
Description	Status	Progress	Action
ibaManagementStudio Agent: Generate support file	Finished successfully	100%	 Download  Remove
Install ibaCapture	Finished successfully	100%	 Remove
Install ibaHD-Server	Executing ibaHdSetup_v3.4.4.exe	85%	 Abort
Install ibaPDA	Task pending		 Abort

The tab shows the following tasks:

- Downloading files, e.g. support files
- Installing software updates
- Updating MARX licenses

If you have opened the Tasks tab at folder level, the system on which the tasks are running is also shown.

In the *Action* column, you can perform various actions depending on the task and status, which you can otherwise perform in the respective dialog box, e.g. when updating software. You can abort the task if it has not yet been completed or remove completed tasks from the list. You can also download generated download files here.

Note

If you abort tasks, the system may remain in an undefined state.
It is recommended to cancel updates only during the installer upload.

5.12 General information about ibaManagementStudio

In the help menu, you find general information about your *ibaManagementStudio* version, the license used, the terms of use and a link to iba support.

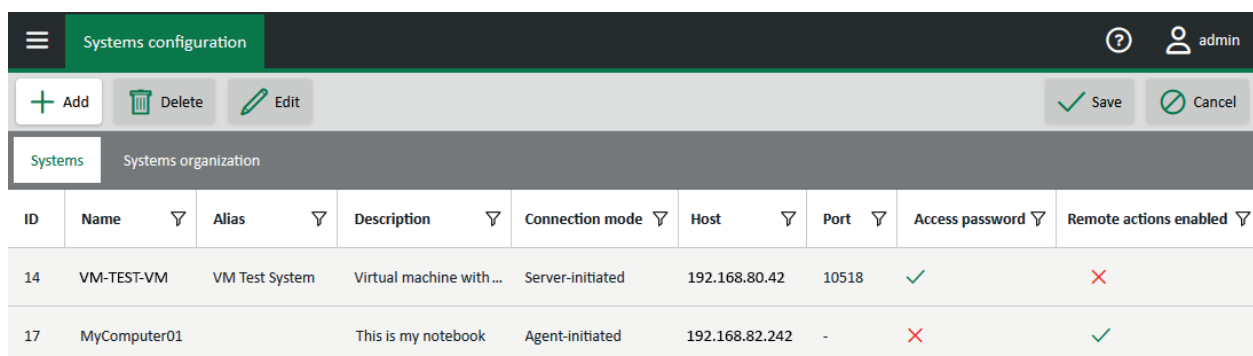

Under *Help*, you find the HTML help for *ibaManagementStudio*, for which you do not need internet access. The *iba Help portal* entry leads you to a website where you can find all documentation on iba products.

6 Configuration via the web client

ibaManagementStudio offers various configuration options for efficient system management. You can adjust system settings, organize the folder structure, and configure server parameters. This keeps the system layout clear and flexible. The following sections explain each step in detail.

6.1 Editing systems

Systems on which you have installed the agent application of *ibaManagementStudio* can be added, edited, deleted or grouped under *Settings – Systems configuration*.

ID	Name	Alias	Description	Connection mode	Host	Port	Access password	Remote actions enabled
14	VM-TEST-VM	VM Test System	Virtual machine with ...	Server-initiated	192.168.80.42	10518	✓	✗
17	MyComputer01		This is my notebook	Agent-initiated	192.168.82.242	-	✗	✓

The table shows the following information:

ID	internal ID of <i>ibaManagementStudio</i>
Name	Name of the connected system
Alias	changeable display name of the connected system
Description	Entered description
Connection mode	Connection mode of server and agent
Host	Agent host address
Port	Agent port number
Access password	Shows whether a password is set in <i>ibaManagementStudio</i> Agent Status
Remote actions enabled	Shows whether remote updates are allowed on this system

You can sort the table in ascending or descending order by clicking on a column header.

Using the filter button, you can filter the table entries.

Information on Multicast

The UDP port 10517 is only required if you want to use the agent search from the *ibaManagementStudio* Server. If a multicast is not possible (e.g. with strict separation of OT and IT), the port is not required.

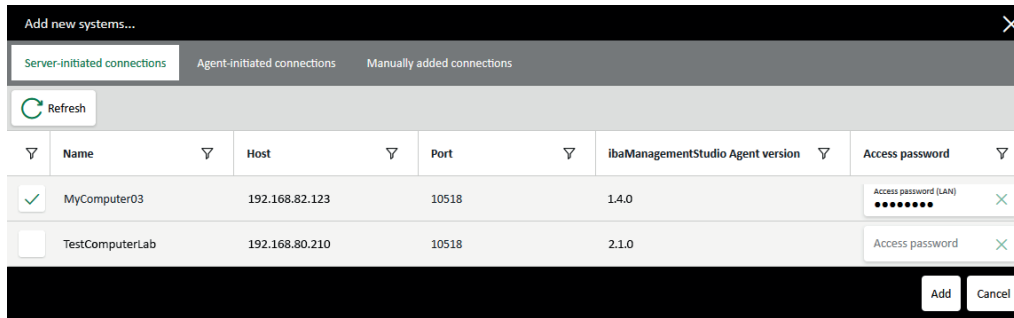

Adding a system

You can only add systems on which you have installed the *ibaManagementStudio* agent application.

We recommend manually adding systems with an agent-initiated connection. The server does not always find these systems automatically.

1. Click on <Add>.

→ *ibaManagementStudio* searches for all reachable agents in the selected communication mode and lists these systems in a dialog window.

2. In the newly opened window, select the *Server-initiated connections* or *Agent-initiated connections* tab.

3. Select one or more systems.

Optional for Server-initiated connections: In the line of the newly added system, in the *Access password* field, enter the password that you have assigned in *ibaManagementStudio* Agent Status, see ↗ *Settings in ibaManagementStudio Agent Status*, page 21.

4. Click on <Add>.

→ The new system is now added to the system list.

5. Save the changes.

→ *ibaManagementStudio* then confirms the change and the system is successfully added.

Adding a system manually

If the desired system was not found during the automatic search of *ibaManagementStudio*, you can add the system manually.

1. Click on <Add>.

2. In the newly opened window, select the *Manually added connections* tab.

3. Specify the host name, port number and, if necessary, the password of the desired system and click the <+> button.

4. Select one or more systems and click on <Add>.

→ The new system is now added to the system list.

5. Save the changes.

→ *ibaManagementStudio* then confirms the change and the system is successfully added.

Editing systems

You can edit added systems afterwards, e.g. replace the system with another one or add a description.

Select a system and click on <Edit>. In the dialog, you can change the following: Alias, description, host name, port number, access password, permission for remote actions.

Note

You can always update the *ibaManagementStudio* Agent via the web client – even if you did not enable remote actions for the system.

Click on <Reset> in the dialog to reset the settings made as well as the selection to replace a system.

Click on <Apply> in the dialog to confirm the changes for the system.

To finally apply the changes for all systems, click <Save> on the *Systems configuration* page.

Note

If you want to change the connection mode of the system, you have to open *ibaManagementStudio* Agent status locally on the respective computer and make the change there, see [➤ Settings in ibaManagementStudio Agent Status](#), page 21. After that, you can replace the original system with the system that has the new connection mode.

Replacing a system

Via the *Edit system* dialog, you can also replace the system. In doing so, *ibaManagementStudio* transfers the user permissions for the original system to the new system.

The *Replace with* area displays systems that you can use to replace the existing system.

If you click on a system in the *Replace with* area, the fields in the *Settings* area show the information on the new system.

Deleting a system

Remove a selected agent system with <Delete>.

The system is then deleted from the system management and folder structures.

6.2 Grouping and organizing systems

Under *Settings – Systems configuration* in the *Systems organization* tab, you can create folders to group the systems according to your needs, for example by location or logical context (such as all *ibaAnalyzer* computers, all *ibaPDA* computers). A system can also be contained in several folders.

Creating folders and grouping systems

1. Click on <Add>.
2. Enter a folder name and click on <Add>.
→ The new folder is now added to the system structure.
3. Drag & drop the required systems from the *All Systems* list into the corresponding folder.

Editing and arranging folders

To change the folder name, select a folder and click <Edit>.

You cannot change the name of the root directory here, but only in the *Server configuration* menu, see ↗ *Changing the server name*, page 41.

Using the buttons in this tab, you can arrange the systems and folders as you wish.

6.3 Changing the server name

In the main menu under *Settings – Server configuration* you can change the display name of the server.

Enter a name in the *Server alias* field and save the changes.

Server configuration

Download ibaManagementStudio Server support file

Save Cancel

Server alias
Root

Automatically apply Auto-Updates for WIBU licenses
Disabled

6.4 Storing remote system credentials

Note

This function is only available with the *ibaManagementStudio+* license.

If you store remote access data for systems, you do not need to enter the access data again when updating the software on these systems. You can save a lot of time, especially if you are updating several systems at the same time, see [Updating iba software products on multiple systems](#), page 48.

In the main menu under *Settings – Remote system credentials*, you can store access data for each system to which you have access. This access data is only saved for your *ibaManagementStudio* user and have no effect on the settings of other users.

1. Enter a remote user name and the corresponding password as default data for the desired systems.

2. Confirm the entries with <Save>

Note

The remote system credentials are secured in the database of the *ibaManagementStudio* Server using multi-layer two-factor encryption.

Decryption is only possible by the server process on the system on which the data was originally encrypted. Even with full database access, decryption by third parties (including iba employees) is not possible.

7 Managing iba software in the web client

ibaManagementStudio offers various features for efficient management of iba software. You can organize the software repository, perform remote updates, create support cases, and update licenses. Diagnostic and support functions help identify and resolve issues early. The following sections explain each step in detail.

7.1 Update files and file repository

Note

This function is only available with the *ibaManagementStudio+* license.

In the web client in the main menu under *Repository*, you can load installer files for updates of supported iba software products into the local file store. The files are located in a file repository on the computer on which *ibaManagementStudio* server is running, see [↗ Settings in ibaManagementStudio Server Status](#), page 19.

Note

ibaManagementStudio creates a folder structure in the repository directory that you must not change or delete. Otherwise, the repository and the remote update stop working.

When you change the location of the repository, you can choose to transfer the previous data to the new location. This allows you to ensure that the repository and remote update continue to work correctly.

Repository

?

admin

Refresh

Synchronization mode: Central repository (Online)
Last check: 3/13/2025 3:06:08 PM

Selected iba SW product
ibaCapture

SW product type	Installer version	Installer file name
ibaCapture	5.3.0	ibaCaptureSetup_v5.3.0.exe
ibaCapture	5.4.0	ibaCaptureSetup_v5.4.0.exe

To view and edit the repository in the web client, you need the *Manage settings* permission in the *ibaManagementStudio* user management.

With the installer files in the repository, you can update supported iba software products via the web client, see [↗ Updating iba software products via the web client](#), page 45, or locally via *ibaManagementStudio* Agent Status in the Updates tab, see [↗ Updates via ibaManagementStudio Agent Status](#), page 22.

You can sort the table in ascending or descending order by clicking on a column header.

Using the filter button, you can filter the table entries.

Note

ibaManagementStudio supports only updating iba software products. You cannot perform clean installations via *ibaManagementStudio*.

View of the available installer files for updates

Under *Repository* in the main menu, you can view the respective iba software product with the available installer files via a drop-down list. The drop-down list contains all supported iba software products. *ibaManagementStudio* displays the version of the installer file as well as its name for each iba software product.

Loading installer files for updates into the repository via the web client

1. Under *Repository* in the main menu, click <Add>.

For adding installer files, the iba software product selected in the list is not relevant.

2. Select the installer file via <Select file>.

Already existing installer files with the same name will be overwritten. However, if these files are currently in use, *ibaManagementStudio* aborts the upload.

3. Click <Upload> to add the file to the repository.

4. Confirm the upload with <OK>.

→ When you select the appropriate software in the drop-down list, you can see the newly added installer file.

If you cannot see newly added installer files and no errors occurred during the upload, click <Refresh>.

→ *ibaManagementStudio* updates the update notifications in the system overview.

Deleting files from the repository

You can also delete older installer files via the web client.

1. Select installer files of a software.
2. Click on <Delete> and confirm the message.

→ The installer files are deleted from the repository in the web client and therefore also from the local file repository of the server.

Note

You cannot delete the latest installer file of a software.

7.2 Updating iba software products via the web client

Note

This function is only available with the *ibaManagementStudio+* license.

From the web client, you can update supported iba software products on the connected systems. New installations of iba software products or downgrades of the software version are not possible.

Before installing the software, *ibaManagementStudio* checks the authenticity of the installer files via different procedures and the EUP date. If the currently licensed EUP date does not cover the new software version, the installation is aborted.

During the installation, the services of the respective iba software products are stopped on the system.

You can track the status of the update at any time in the *Tasks* tab.

Note

To perform a remote update on a connected system, you must be able to log on to that system with a local Windows account that has permission to perform installations. You can also store the credentials in the web client, see ↗ *Storing remote system credentials*, page 42.

Prerequisites

- For the system on which you want to perform the remote update, the permission for remote actions is enabled, see ↗ *Editing systems*, page 40.
- On the system on which you want to perform the remote update, the *ibaManagementStudio* Agent service (v2.0.0 or higher) is running and a connection to the *ibaManagementStudio* server is established.
- *ibaManagementStudio* supports the selected iba software product.
- You also need the "Edit" permission for the respective system in the *ibaManagementStudio* user management.

7.2.1 Updating iba software products individually

Note

Note that the service of the software products is stopped during the update. This means that e.g. *ibaPDA* cannot acquire signals as long as the update is running.

1. In the main menu under *Systems*, select a system and go to *iba SW product information*.
Alternatively on folder level, you can also find a system that is not updated by selecting the software.
2. Click on <Update> in the list.
→ The web client lists all update files stored in the directory.
3. Select the desired update file and click <Next>.
4. Check the Windows login data if it is already stored.
Otherwise, enter the Windows credentials under which to install the update on the selected system.
5. Click on <Install>, to start the installation.
→ The dialog shows the installation progress.
During installation of *ibaManagementStudio* Agent, the affected system may briefly appear as offline in the system overview.
→ If you close the installation window, the installation will continue anyway. You can check the progress in the *Tasks* tab.

7.2.2 Updating multiple iba software products

You can also update several iba software products on one system. The updates are installed one after the other in the order you specify.

Note

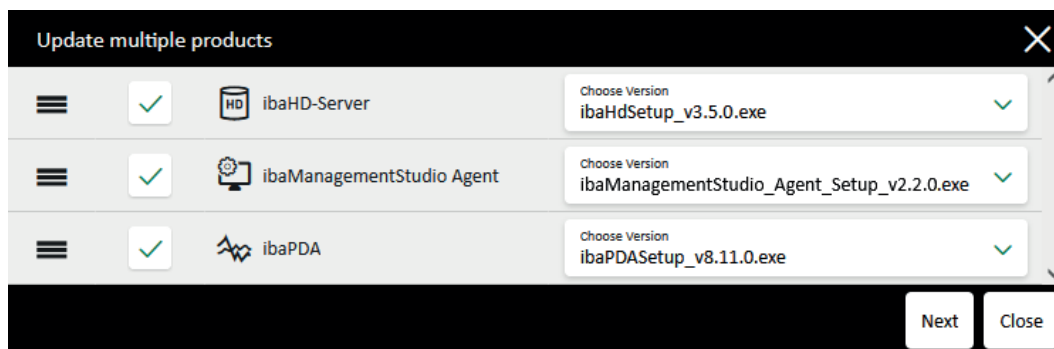

Note that the service of the software products is stopped during the update. This means that e.g. *ibaPDA* cannot acquire signals as long as the update is running.

1. In the main menu under *Systems*, select a system and go to *iba SW product information*.
Alternatively on folder level, you can also find a system that is not updated by selecting the software.

2. Click on <Update multiple products> above the list.

The window displays all software products that you can update.

3. Select the software products that you want to update and select the version of the update file.
4. Set the order of the software during installation by moving the lines on the handle icons on the left.
5. Click on <Next>.
6. Check the Windows login data if it is already stored.
Otherwise, enter the Windows credentials under which to install the update on the selected system.
7. Click on <Install> to start the installation.
 - The dialog shows the installation progress for each software product.
During installation of *ibaManagementStudio Agent*, the affected system may briefly appear as offline in the system overview.
 - If you close the installation window, the installation will continue anyway. You can check the progress in the *Tasks* tab.

7.2.3 Updating iba software products on multiple systems

You can also update an iba software product on several systems. The updates are installed on the systems in parallel.

Note

Note that the service of the software products is stopped during the update. This means that e.g. *ibaPDA* cannot acquire signals as long as the update is running.

1. In the main menu under *Systems*, select a folder and go to *iba SW product information*.
Alternatively on folder level, you can also find a system that is not updated by selecting the software.
2. From the list, select a software product to update on the systems in the folder.
3. Click on <Multi update> next to the drop-down list.
4. Select the version of the update file to install and click on <Next>.
5. Select the systems on which to update the software.

Install ibaHD-Server on multiple systems				
<input checked="" type="checkbox"/>		MyComputer01	Username	Password
<input checked="" type="checkbox"/>		TestComputer	Username iba-User	Password
<input checked="" type="checkbox"/>		MyComputer03	Username UserName02	Password

Previous Install Close

6. Check the Windows login data for the systems if it is already stored.
Otherwise, enter the Windows credentials under which to install the update on the selected systems.
7. Click on <Install> to start the installation.
 - The dialog shows the installation progress for each software product.
During installation of *ibaManagementStudio* Agent, the affected system may briefly appear as offline in the system overview.
 - If you close the installation window, the installation will continue anyway. You can check the progress in the *Tasks* tab.

7.3 Software diagnostics in the web client

Via the main menu item *System*, you can view the diagnostic data of the respective installed software on the software pages of a system in the *General* tab.

In the *General* tab, you can see the status of the software service and all license information about the software.

Depending on the software, there are different additional tabs. For *ibaHD-Server*, for example, there are the tabs *Data Stores*, *Connections* and *ibaHD-API*, as this information is relevant for *ibaHD-Server*. In the individual tabs, you can then see all HD stores, which connection *ibaHD-Server* has with other software (e.g. to *ibaPDA*), and the status of *ibaHD-Server-API*. For *ibaPDA* and *ibaCapture*, other tabs and information are available.

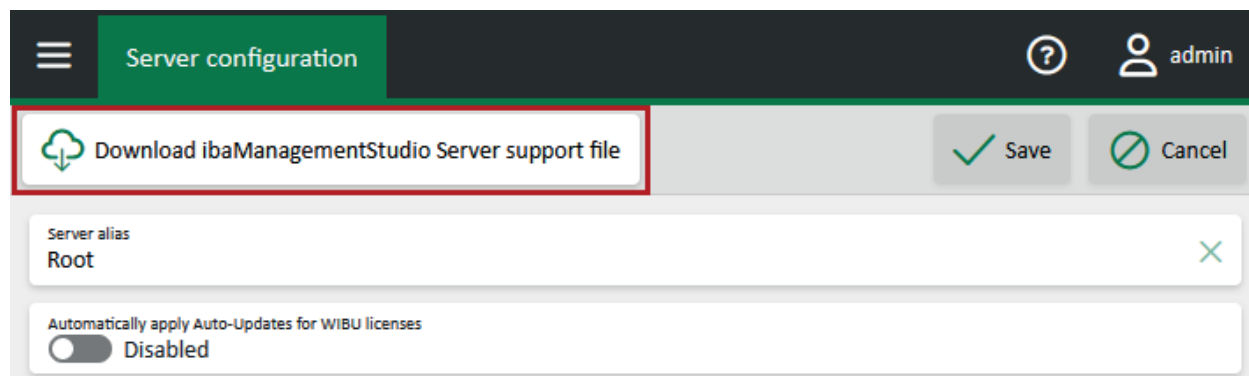

The screenshot displays the web client interface for 'System 'Server01': ibaHD-Server'. The left sidebar shows a tree view with 'Root', 'Type', 'Server', 'Server01', 'Client', 'Location', and 'All Systems'. The 'Server01' node is expanded, showing 'ibaHD-Server'. The main content area has tabs for 'General', 'Data stores', 'Connections', and 'ibaHD-API'. The 'General' tab is active, showing a 'Download support file' button, 'Service' status (Running), version (3.4.3), and 'License' information. The license details include container ID, customer name, expiration date, container type, host, EUP date, and various license options like signals, stores, clients, and time period stores.

License	
License container	130-1234567891
Customer name	iba Intern
License time limit	Expires on 6/30/2025
Container type	WIBU CmActLicense v3.0
Container host	SERVER-01
Required EUP date	11/20/2024
EUP date	11/20/2024
Signals	26148/Unlimited (DEMO)
License options	ibaHD-Server signals (Unlimited) (DEMO) ibaHD-Server stores (16) (DEMO) ibaHD-Server clients (6) (DEMO) ibaHD-Server time period stores (10) (DEMO) ibaHD-Server API read (DEMO) ibaHD-Server-OPC-UA-Server+ (DEMO)
Offline analysis HD clients	0
Connected/licensed HD clients	1/6 (DEMO)
Enabled/licensed ibaHD-Server stores	12/16 (DEMO)
Enabled/licensed ibaHD-Server time period stores	10/10 (DEMO)
Enabled/licensed ibaHD-Server ultra time period stores	0/0

For support cases, you can create a ZIP file in which all relevant settings and configurations are saved by clicking the button <Download support file>. You can send this ZIP file to iba support for troubleshooting assistance, see [Support and contact](#), page 74.

7.4 Downloading a support file for server

In the main menu under *Settings – Server settings*, you can download a ZIP file for iba support.

7.5 License updates in the web client

Note

This function is only available with the *ibaManagementStudio+* license.

You can update licenses of the respective license types via the *ibaManagementStudio* web client.

Under the following conditions, the web client indicates when an update is available for a license:

- MARX licenses:
 - New update files are stored in the corresponding directory on the server, see [Searching for MARX license updates automatically](#), page 53.
 - Update notifications only appear for update files that are newer than the last dongle update.
- WIBU licenses:
 - *ibaManagementStudio* Server can reach the iba Gateway for WIBU licenses, see [Updating WIBU licenses](#), page 54.
 - Update notifications only appear for tickets that are already known to *ibaManagementStudio*. These tickets can be found on the *License* tab under *Associated tickets*.

The screenshot displays the 'License information' tab for the system 'MyComputer01'. The interface includes a sidebar with navigation options like 'Systems', 'Root', 'Type', 'Server', 'Client', 'VM Test System', and 'MyComputer01'. The main content area shows 'Available license containers' with a table listing licenses. A 'Download...' button is visible at the top right of the license list. The 'License options' section provides details for various products, including 'ibaHD-Server', 'ibaPDA Client', and 'ibaPDA Server', with columns for Product, Demo, License time limit, and Quantity.

Product	Demo	License time limit	Quantity
ibaHD-Server	✓	12/31/2026	
ibaHD-Server signals	✓	12/31/2026	Unlimited
ibaHD-Server stores	✓	12/31/2026	16
ibaHD-Server clients	✓	12/31/2026	6
ibaManagementStudio	✓	11/30/2026	
ibaPDA-Interface-OPC-UA-Client			16
ibaHD-Server time period stores	✓	12/31/2026	10
ibaHD-Server API read	✓	11/30/2026	1
ibaHD-Server-OPC-UA-Server+	✓	11/30/2026	1

7.5.1 Updating MARX licenses

Note

This function is only available with the *ibaManagementStudio+* license.

Via the web client, you can update MARX licenses on the connected systems. The update is carried out on the systems in silent mode in the background.

Prerequisites

- For the system on which you want to perform the license update, the permission for remote actions is enabled, see [✎ Editing systems](#), page 40.
 - On the system on which you want to perform the license update, the *ibaManagementStudio* Agent (v2.0.0 or higher) is running and a connection to the *ibaManagementStudio* server is established.
 - You are using *ibaManagementStudio* Server v2.0.0 or higher.
 - You are using *ibaDongleUpgrade* files with a date from October 2023 (*ibaDongleUpgrade* v8.0.0 or higher).
 - You also need the "Edit" permission for the respective system in the *ibaManagementStudio* user management.
 - The names of the update files follow this pattern (like the original file name):
`ibaDongleUpgrade_[dongle_id]_[YYYY_MM_DD].exe`
You can find the dongle ID in *ibaDongleViewer*.
-

Note

ibaManagementStudio does not support MARX license updates that generate confirmation files that must be sent to iba support.

Manually uploading and updating MARX licenses

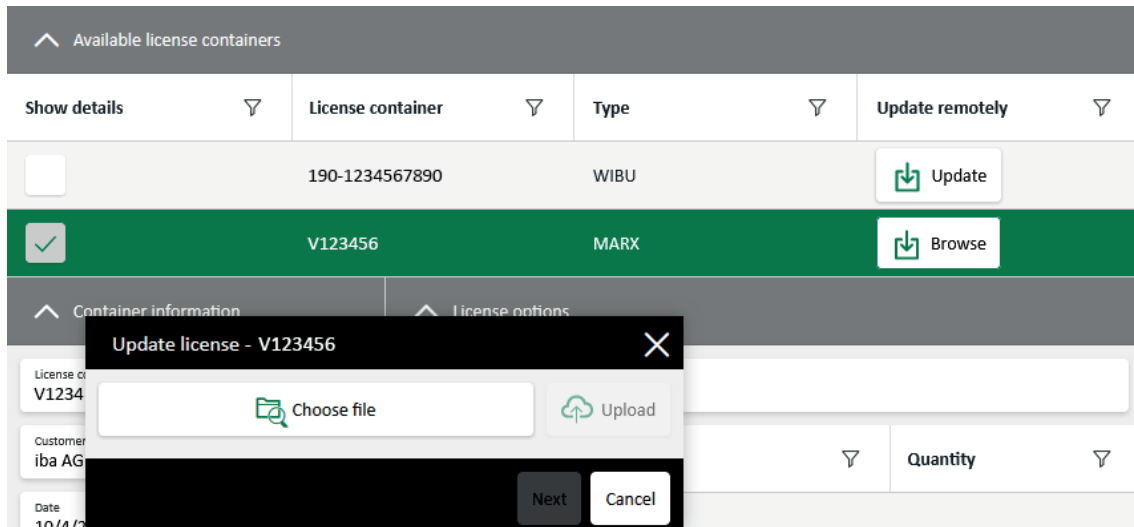

Note

The service of the software products on this system is stopped during the update. This means that e.g. *ibaPDA* cannot acquire signals as long as the update is running.

1. Select a system under *Systems* in the main menu and open the *License information* tab.
2. In the list, click on the <Update> button in the line of a MARX license.

3. Select the desired update file and click <Next>.

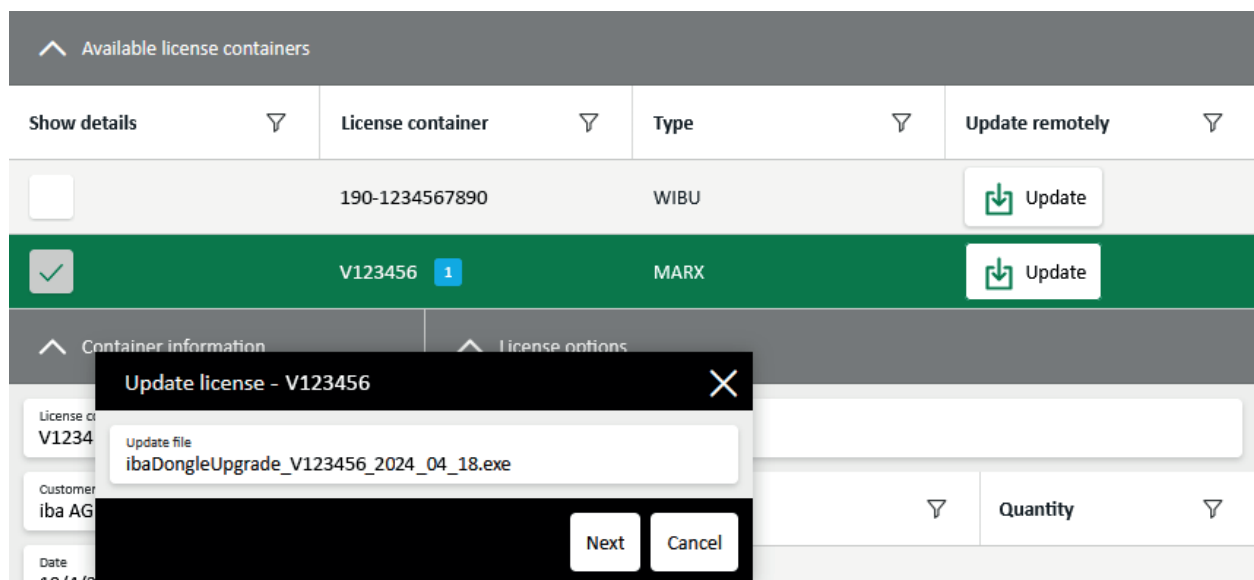

4. Enter Windows credentials, if necessary with domain, under which you install the update on the selected system.
 5. Click on <Install> to start the installation.
- The dialog shows the update progress.

Searching for MARX license updates automatically

You can store the update files in a directory and thus display notifications for available license updates in the web client. You then no longer have to search for and select the new update files in the web client.

In *ibaManagementStudio* Server Status, select a path under *MARX license updates* in the *Settings* tab, see [Settings in ibaManagementStudio Server Status](#), page 19.

In the web client, you can now perform a license update via the <Update> button in the *License information* tab under *Systems* in the main menu. For the update, *ibaManagementStudio* uses the update file from the directory for MARX license updates.

7.5.2 Updating WIBU licenses

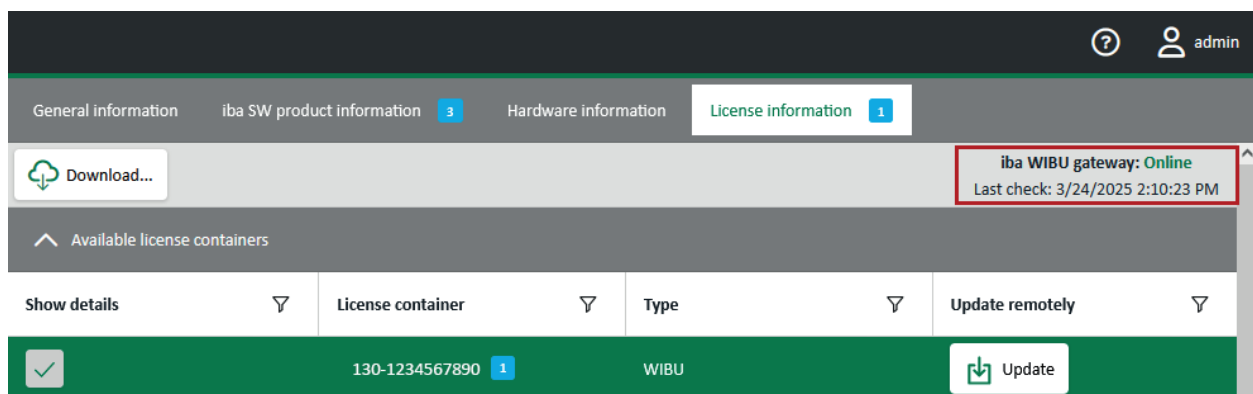

Note

This function is only available with the *ibaManagementStudio+* license.

Via the web client, you can update WIBU licenses on the connected systems. The update is carried out on the systems in the background. When the licenses are updated, license entries are activated on the WIBU ticket.

ibaManagementStudio Server automatically establishes a connection to the iba Gateway for WIBU licenses. In this way, you can update the licenses using the <Update> button.

Under certain circumstances, however, *ibaManagementStudio* Server cannot reach the iba Gateway, in which case you must perform a file-based license update, see [Updating WIBU licenses file-based](#), page 58.

Prerequisites

- For the system on which you want to perform the license update, the permission for remote actions is enabled, see [Editing systems](#), page 40.
- On the system on which you want to perform the license update, the *ibaManagementStudio* (v2.0.0 or higher) is running and a connection to the *ibaManagementStudio* server is established.
- You are using *ibaManagementStudio* Server v2.0.0 or higher.
- You also need the "Edit" permission for the respective system in the *ibaManagementStudio* user management.
- There is a connection to the iba Gateway for WIBU licenses.
- The terms of use for internet access have been accepted and an internet connection is established.

Updating WIBU licenses via the iba Gateway

Note

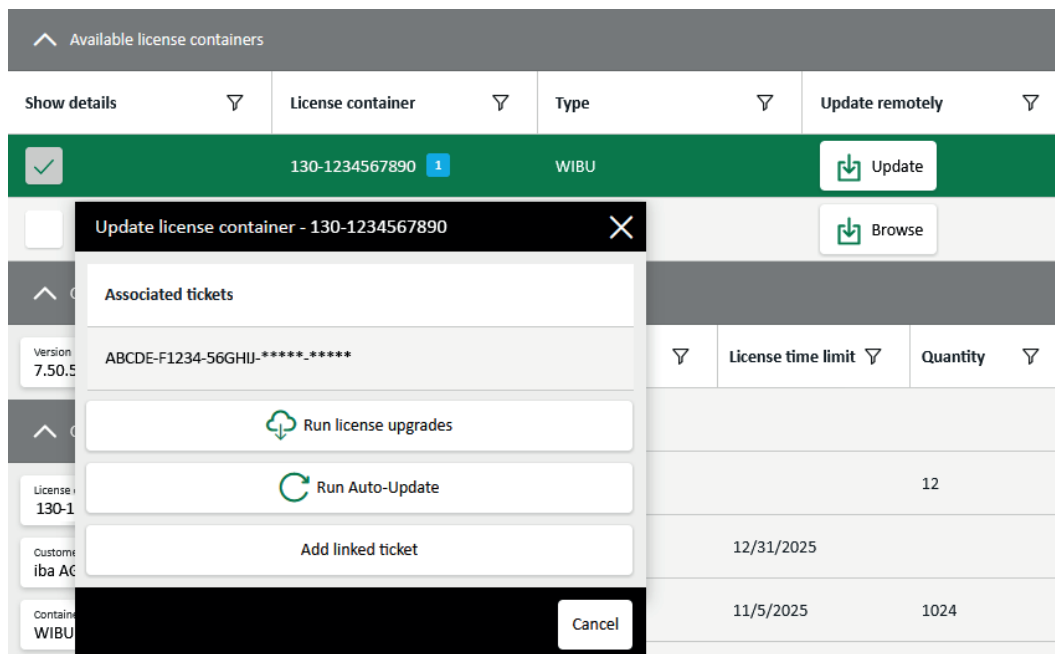

The service of the software products on this system is stopped during the update. This means that e.g. *ibaPDA* cannot acquire signals as long as the update is running.

1. Select a system under *Systems* in the main menu and open the *License information* tab.
2. In the list, click on the <Update> button in the line of a WIBU license.

Confirm the warning if you want to continue with the license update despite possible status changes.

- A dialog window with the associated tickets of previous updates opens.
- If you have not yet performed a license update, enter a ticket number.

3. If required, you can enter further WIBU tickets using the <Add linked tickets> button.
4. Click on <Run license upgrades> so that *ibaManagementStudio* searches for the licenses of the specified tickets at the iba Gateway for WIBU licenses.
5. Select the tickets you want to upgrade. You cannot select or deselect individual licenses.

Under certain circumstances, license orders or changes can be linked to a WIBU container. License entries from these orders are referred to as Auto-updates and are always executed in the update process regardless of the WIBU action or the selected ticket.

ibaManagementStudio marks such license entries with the tag *[Auto-Update]*. Auto-updates can also be performed without activating other licenses, see [Running Auto-updates](#), page 56.

6. Click on <Activate> to start the update process in the background.

→ The dialog shows the update progress.

→ *ibaManagementStudio* saves tickets that you have newly entered in the ticket list for future updates.

If an error occurs during the update, *ibaManagementStudio* displays a WIBU error code that you can forward to iba support.

7.5.2.1 Running Auto-updates

Note

This function is only available with the *ibaManagementStudio+* license.

Under certain circumstances, license orders or changes can be linked to a WIBU container, e.g. an extension of EUP dates. License entries from these orders are referred to as Auto-updates and are always executed in the update process regardless of the WIBU action or the selected ticket. *ibaManagementStudio* marks such license entries with the tag *[Auto-Update]*.

Prerequisites

- Auto-updates are available.
- For the system on which you want to perform the license update, the permission for remote actions is enabled, see [✎ Editing systems](#), page 40.
- On the system on which you want to perform the license update, the *ibaManagementStudio* Agent (v2.0.0 or higher) is running and a connection to the *ibaManagementStudio* server is established.
- You are using *ibaManagementStudio* Server v2.0.0 or higher.
- You also need the "Edit" permission for the respective system in the *ibaManagementStudio* user management.
- There is a connection to the iba Gateway for WIBU licenses.
- The terms of use for internet access have been accepted and an internet connection is established.

Running Auto-updates without further license update

1. Select a system under *Systems* in the main menu and open the *License information* tab.
2. In the list, click on the <Update> button in the line of a WIBU license.

Confirm the warning if you want to continue with the license update despite possible status changes.

→ A dialog window with the associated tickets of previous updates opens. Auto-updates are also displayed here.

3. Select <Run Auto-Update>.
4. Click on <Auto-Update> to update the displayed Auto-updates.

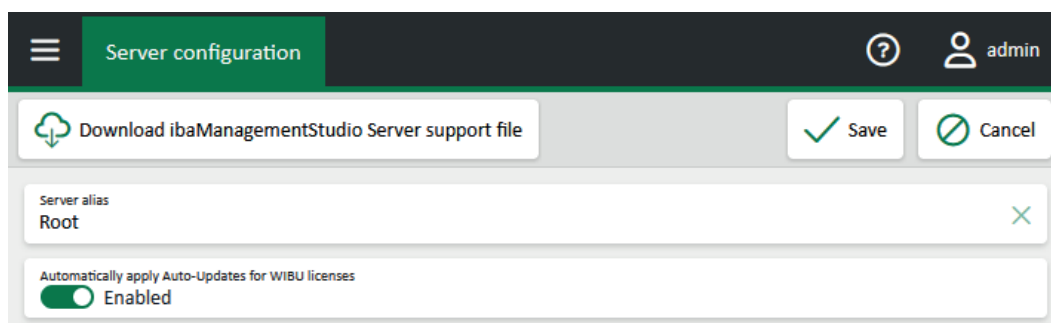

→ The dialog shows the update progress.

Running auto-updates automatically

You can set *ibaManagementStudio* to run the Auto-updates automatically without any interaction on your part. *ibaManagementStudio* then checks every 24 hours whether Auto-updates are available and runs them on all connected systems.

This function is deactivated by default.

1. Open *Settings – Server configuration* in the main menu.
2. Click on the field *Automatically run available upgrades for WIBU licenses* to activate or deactivate it.

→ *ibaManagementStudio* checks every 24 hours whether Auto-updates are available and runs them on all connected systems.

7.5.2.2 Updating WIBU licenses file-based

Note

This function is only available with the *ibaManagementStudio+* license.

You have to use the file-based update via the web client of *ibaManagementStudio* if *ibaManagementStudio* Server cannot reach the iba Gateway for WIBU licenses.

Prerequisites

- For the system on which you want to perform the license update, the permission for remote actions is enabled, see [✎ Editing systems](#), page 40.
 - On the system on which you want to perform the license update, the *ibaManagementStudio* (v2.0.0 or higher) is running and a connection to the *ibaManagementStudio* server is established.
 - You are using *ibaManagementStudio* Server v2.0.0 or higher.
 - You also need the "Edit" permission for the respective system in the *ibaManagementStudio* user management.
 - There is no connection to the iba Gateway for WIBU licenses.
-

Other documentation

Further information on handling WIBU licenses in the *CodeMeter License Central WebDepot* of iba can be found in the manual *WIBU CodeMeter for iba Users*.

Updating WIBU licenses file-based

Note

The service of the software products on this system is stopped during the update. This means that e.g. *ibaPDA* cannot acquire signals as long as the update is running.

1. Select a system under *Systems* in the main menu and open the *License information* tab.
 2. In the list, click on the <Update> button in the line of a WIBU license.
- A dialog box with 3 tabs appears.

3. In the *Request file* tab, download the license request file with the extension .WibuCmRaC.

The screenshot shows the 'Available license containers' section of the ibManagementStudio web client. A table lists license containers with columns for 'Show details', 'License container', 'Type', and 'Update remotely'. Two containers are visible: one with ID '130-1234567890' of type 'WIBU' and another with ID 'V123456' of type 'MARX'. A modal window titled 'Update license container - 130-1234567890' is open, showing the 'Request File' tab. This modal contains a 'Generate WIBU request file' section with a 'Status' field and a 'Download' button. In the background, a table shows license details with columns for 'License time limit' and 'Quantity'.

License container	Type	Update remotely
130-1234567890	WIBU	Update
V123456	MARX	Browse

License time limit	Quantity
12/31/2026	12
12/31/2026	1
12/31/2026	1
12/31/2026	2

4. Open *CodeMeter License Central WebDepot* of iba in a new window/tab of your web browser:

<https://license.iba-ag.com/index.php>

- Enter the ticket number for your WIBU license.
- Select the licenses you want to update and click <Activate Licenses>.
- Select *File-based license transfer* under the license overview.

The screenshot shows the 'Available Licenses' section of the iba CodeMeter License Central WebDepot. It includes a navigation bar with 'HOME', 'LICENSES', and 'HELP'. A section titled 'To activate your licenses:' provides instructions: 1. Select the licenses you want to activate. 2. Select the locally connected CmContainer to which you want to transfer the licenses. 3. Click 'Activate Selected Licenses Now'. Below this is a table of available licenses with columns for 'Name', 'Ticket', 'Activated On', 'CmContainer', and 'Status'. All licenses are marked as 'Available: 1 (1)'. At the bottom, there is a 'Select CmContainer' dropdown menu showing '130-1234567890 (iba AG Soft License)' and an 'Activate Selected Licenses Now' button. A red box highlights the 'File-based license transfer' option in the bottom right corner.

Name	Ticket	Activated On	CmContainer	Status
iba License Identifier	130-1234567890	-		Available: 1 (1)
ibaPDA-256 Demo	130-1234567890	-		Available: 1 (1)
ibaPDA-Interface-Audio Demo	130-1234567890	-		Available: 1 (1)
ibaPDA-Interface-MQTT Demo	130-1234567890	-		Available: 1 (1)
ibaPDA-Interface-OPC-UA-Client Demo	130-1234567890	-		Available: 1 (1)
ibaPDA-Interface-ibaNet-E Demo	130-1234567890	-		Available: 1 (1)
ibaQPanel-Add-On Demo	130-1234567890	-		Available: 1 (1)

- d) Select the license request file with the extension .WibuCmRaC in the corresponding field and upload the file via <Start Activation Now>.

Upload Request | Download Update | Upload Receipt

To activate your licenses via file transfer - First step "Upload Request":

If you have activated licenses from this ticket already, you can transfer additional licenses into the same CmContainer(s). If you want to use another CmContainer, you need a license request file of this new CmContainer.

1. Select an already used CmContainer or create a license request file with **Firm Code 6000506** for the CmContainer where you want to transfer the licenses to. This file can for example be created with CodeMeter Control Center. How it works: [3](#)
2. Select the licenses you want to activate.
3. Select the created license request file.
4. Click "Continue".

<input checked="" type="checkbox"/>	Name	Ticket	Activated On	CmContainer	Status
<input checked="" type="checkbox"/>	iba License Identifier	00000000000000000000000000000000	-		Available: 1 (1)
<input checked="" type="checkbox"/>	ibaPDA-256 Demo	00000000000000000000000000000000	-		Available: 1 (1)
<input checked="" type="checkbox"/>	ibaPDA-Interface-Audio Demo	00000000000000000000000000000000	-		Available: 1 (1)
<input checked="" type="checkbox"/>	ibaPDA-Interface-MQTT Demo	00000000000000000000000000000000	-		Available: 1 (1)
<input checked="" type="checkbox"/>	ibaPDA-Interface-OPC-UA-Client Demo	00000000000000000000000000000000	-		Available: 1 (1)
<input checked="" type="checkbox"/>	ibaPDA-Interface-ibaNet-E Demo	00000000000000000000000000000000	-		Available: 1 (1)
<input checked="" type="checkbox"/>	ibaQPanel-Add-On Demo	00000000000000000000000000000000	-		Available: 1 (1)

Upload Receipt Now **Back** Direct license transfer

8 User management in ibaManagementStudio

You can find the user management in the main menu of the web client under *User management*.

User management allows the creation of different user accounts and supports both individual users and groups:

Local users/ Local groups	The access information is only valid for logging in to <i>ibaManagementStudio</i> and is set up and managed by the administrator user.
Domain users/ Domain groups	The administrator user registers the domain groups or domain users in the <i>ibaManagementStudio</i> user management system. Thus, the access information for the domain can also be used to log in to <i>ibaManagementStudio</i> .

All users and groups are sorted alphabetically. However, the user "admin" and the user group "Administrators" are always at the top position.

Permissions for users and groups

You can assign different permissions to the users and groups. A user can be a member of one or more groups. These groups can have different rights. The user's own rights and the rights of the groups complement each other to create the effective permissions for the user.

Domain users and domain groups

If the computer on which *ibaManagementStudio* server is running belongs to a domain, it is possible to add users and user groups from that domain. Please note that including a domain group also grants access to *ibaManagementStudio* to all domain users who are members of the group. If you add a single domain user, even though its domain group is already configured, you can assign special and advanced permissions to the user over and above those permissions assigned to its domain group.

Note

In most scenarios, the *ibaManagementStudio* server service runs under the system account. If the system account only has very limited domain rights, it is advisable to run the *ibaManagementStudio* server service under a dedicated account with domain access.

Note

When logging in as a domain user in the web client, it is not necessary to specify the domain name in the *Username* field. It is sufficient to use only the user's username or e-mail address.

Username
Domainuser

Password
.....

Log in

However, if *ibaManagementStudio* is running in an environment with multiple Active Directory domains, the username should still be preceded by the domain name.

Username
somedomain\Domainuser

Password
.....

Log in

8.1 Creating and managing users

After first installation, only one administrator user ("admin") exists, which always has all rights. The administrator is the only user that is not subject to any restrictions and can add or delete other users as well as change their user rights. The name "admin" cannot be changed. All users or domain users added later can be assigned the same rights as the administrator user.

Creating local users

1. Create a new local group via the <Add> button and select <Add Local User>.

2. Enter the name, e-mail address and password in the input fields.

Note

The **login name** may only contain letters and digits. Spaces or special characters are not supported.

Note

The **password** must contain at least 6 characters and consist of uppercase letters, lowercase letters, numbers, as well as special characters.

3. Assign the permissions for the user under *User permissions*, see also ↗ *User permissions*, page 65.
4. If you want to assign the user to a group, select the group under *Group memberships*, see also ↗ *Creating and managing user groups*, page 68.
5. Save your entries.

Use the <Delete> button to delete the selected user/domain user.

Creating domain users

1. Create a new domain user via the <Add> button and select <Add Domain User>.
2. Specify the full name of the domain and the login name.
3. Assign the permissions for the user under *User permissions*, see also ↗ *User permissions*, page 65.
4. If you want to assign the user to a group, select the group under *Domain group memberships*, see also ↗ *Creating and managing user groups*, page 68.
5. Save your entries.

Note

The domain login name must not be identical to the local login name, otherwise the domain user cannot be saved.

8.2 User permissions

If a user is member of a group, it gets the permissions of that group. If a user belongs to multiple user groups, the sum of all user group permissions applies to the user. If a user has more granted permissions than the user group, the user keeps its permissions.

The applicable permissions for the currently selected user, i.e., the user rights and group permissions, are shown as *Effective permissions*.

Assigning permissions

You can assign different permissions to a user. The rights of the currently selected user are selected and listed in the *User permissions* sub-tab.

Enable or disable the desired permissions for a user.

Option	Description
<i>Manage users</i>	Allows you to create, change and delete users and user groups
<i>Manage settings</i>	Enables access to the <i>Settings</i> menu and thus to <i>Systems configuration</i>
<i>Change own password in user profile</i>	The permission to change the user's own password is enabled by default for all users, i.e., the checkmark is set. If users or groups are not allowed to change their own password, disable this permission.

Note

You cannot disable any permissions for the "admin" user because this user always has all permissions.

Group permissions

Group permissions apply to all group members and cannot be removed from individual group users. However, you can assign additional rights to individual group users.

The effective permissions that were assigned to a user are selected under *Effective permissions*.

The previously created groups are listed under *Group memberships*. To create new groups, see [Creating and managing user groups](#), page 68.

You can enable or disable a user's membership of a group under *Group memberships*.

8.3 System permissions

In the *System permissions* tab, individual users or user groups can be assigned the permission to manage systems connected to *ibaManagementStudio*.

User permissions		System permissions	
Name	Group permission	User permission	Effective permission
 Root	Edit	None View	View
 Type	View	None View	View
 Server	View	None View	-
 Server01 (127.0.0.1)	Edit	None View Edit	Edit

The connected systems are displayed in an overview. You can enable the permission to edit the systems for groups or individual users.

<None> The user or group does not have permission to view or edit the corresponding system.

<View> The user or group has permission to view the corresponding system under *Systems*.

<Edit> The user or group has permission to view the corresponding system under *Systems* and edit it in *Settings*.

The user also needs permission to manage systems (*Manage Settings*) under *User permissions* or *Group permissions*.

In the case of system permissions, the respective access restrictions take precedence over the user's access rights. If a user is a member of a group, it is subject to the group's access restrictions in each case. If a user belongs to multiple user groups, the sum of all access restrictions applies. If a user has more permissions than the user group, the group's access restrictions also

restrict the user permissions. This means you cannot give additional permissions to a user unless the group has the same permissions. You can only remove permissions from the user. The following table illustrates this subtractive permission assignment.

Group permission			User permission			Effective permission
<i>None</i>	<i>View</i>	<i>Edit</i>	<i>None</i>	<i>View</i>	<i>Edit</i>	
X			X			None
X				X		None
X					X	None
	X		X			None
	X			X		View
	X				X	View
		X	X			None
		X		X		View
		X			X	Edit
N	N	N	N	N	N	None
N	N	N	X			None
N	N	N		X		View
N	N	N			X	Edit
X			N	N	N	None
	X		N	N	N	View
		X	N	N	N	Edit

X = permission assigned, N = nothing selected

If a user has access rights to a folder but not to the systems within it, that folder is not listed under *Systems*. If a user has access rights to a system but not to the folder it is in, only the system is listed under *Systems*.

8.4 Creating and managing user groups

In addition to users, groups can be created and assigned different permissions. If a user is member of a group, it gets the permissions of that group. If a user belongs to multiple user groups, the sum of all user group permissions applies to the user. If a user has more granted permissions than the user group, the user keeps its permissions.

The applicable permissions for the currently selected user, i.e., the user rights and group permissions, are shown as *Effective permissions*.

After the first installation, the "Administrators" group is available. This group has all permissions. You cannot disable the permission to change your own password for the "Administrators" group, because members of this group always have the right to change their own password.

Creating local groups

1. Create a new local group via the <Add> button and select <Add Local Group>.
2. Enter the group name and an optional description in the input fields.

The screenshot shows the 'User management' interface. At the top, there's a header with a menu icon, 'User management', a help icon, and a user icon labeled 'admin'. Below the header, there are buttons for '+ Add' and 'Delete', and 'Save' and 'Cancel' buttons. The main area is divided into three sections: 'User management' (left sidebar), 'Group permissions' (middle), and 'System permissions' (right). The 'User management' sidebar has a search bar and a list of users and groups: 'Local users' (admin, Testuser), 'Local groups' (Administrators, New Group). The 'Group permissions' section has a 'Name' field with 'New Group', a 'Description' field, and a 'Group permissions' section with checkboxes for 'Manage users', 'Manage settings', and 'Change own password in user profile'. The 'System permissions' section has a 'Group members' section with a search bar and a list of users: 'admin', 'Testuser'.

Note

You can freely assign group names and descriptions.

3. Save your entries.

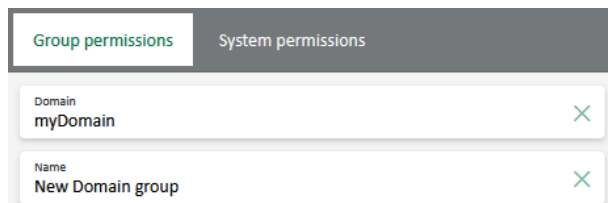

You can edit the group name and the description by clicking in the corresponding field and changing the entry.

Use the <Delete> button to delete the selected group/domain group.

Creating domain groups

1. Create a new domain group via the <Add> button and select <Add Domain Group>.
2. Enter the group name in the input fields.

For domain groups, you additionally have to enter the domain name.

3. Save your entries.

In case the specified group is not in the domain, an error message appears.

Assigning permissions

You can assign different permissions to a group. The rights of the currently selected group are selected and listed in the *Group permissions* sub-tab.

Enable or disable the desired permissions for a group.

Option	Description
<i>Manage users</i>	Allows you to create, change and delete users and user groups
<i>Manage settings</i>	Enables access to the <i>Settings</i> menu and thus to <i>Systems configuration</i>
<i>Change own password in user profile</i>	The permission to change the user's own password is enabled by default for all users, i.e., the checkmark is set. If users or groups are not allowed to change their own password, disable this permission.

In the *System permissions* sub-tab, you can also assign system permissions to groups. For more details, see [🔗 System permissions](#), page 66.

Adding users

Local users can only be assigned to local groups. For domain users, the group membership is fixed. If a domain group has been integrated and the individually created user belongs to this group, only this group affiliation is displayed; it cannot be changed (except for the IT domain management).

There are two ways to add users to a group.

- The *Group members* sub-tab lists all users who can belong to the group. Members of the currently selected group are indicated via a checkmark.
Enable or disable the desired users per group.
- The group membership of a user can also be set in their user profile, in *User permissions* under *Group memberships*, see [🔗 Creating and managing users](#), page 63.

8.5 User-specific language setting

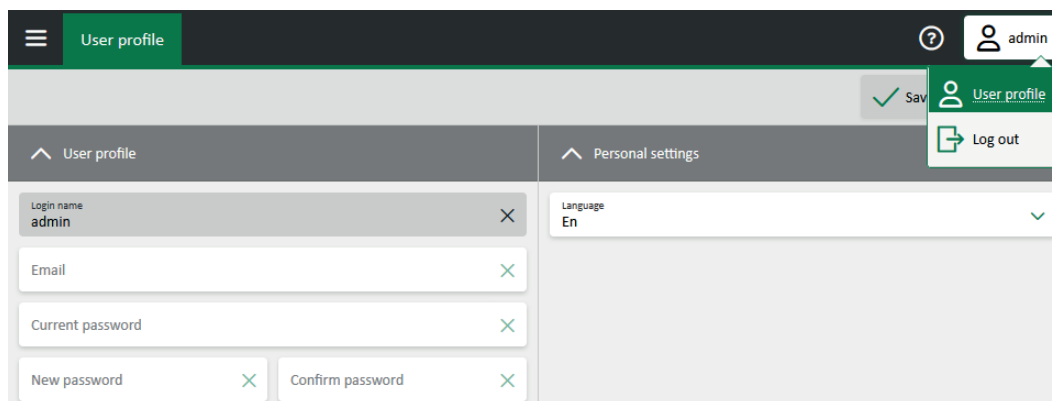

For the web client, you can set a preferred language for each user or each user can set the language independently. To do this, go to the user profile and select the appropriate setting under *Language*.

The web client supports the following languages:

- Auto (browser language setting; if the web client does not support the language, English is used.)
- German
- English
- French
- Spanish
- Italian
- Portuguese
- Russian
- Chinese (simplified)

8.6 Changing the password

If your user has been assigned the change-password permission, you can change the password in the settings for your user profile.

1. Open your user profile.
2. Enter your current password.
3. Enter your new password. Confirm the password by entering the new password again.

Note

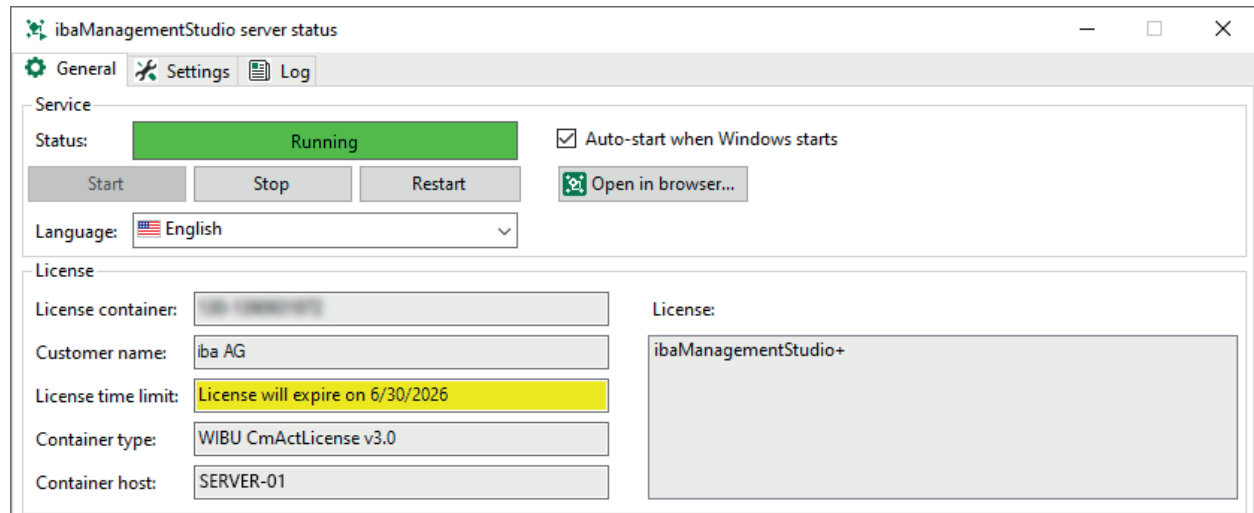

The **password** must contain at least 6 characters and consist of uppercase letters, lowercase letters, numbers, as well as special characters.

4. Save your changes.

9 Diagnostics

9.1 Checking the license

If you receive a message about missing licenses in the web client, you can check in *ibaManagementStudio* Server Status if your license for this interface is recognized properly.

10 Troubleshooting

Expired certificates

Problem: *ibaManagementStudio* reports that the certificates have expired.

Solution: If you are using the default certificates of *ibaManagementStudio*, install the latest version of *ibaManagementStudio*. This renews the necessary certificates.

If you use your own certificates, inform your system administrator who can renew the certificates.

Duplicate ID of *ibaManagementStudio* Agent

Problem: *ibaManagementStudio* Agent is part of an image that is installed on several virtual machines. In the web client, multiple *ibaManagementStudio* Agents with the same ID have to be connected, which is not possible.

Solution: Before you create the images, you can delete the ID field in the JSON configuration file of *ibaManagementStudio* Agent. A new ID is then automatically generated when the agent application is started.

Licenses not visible in license view

Problem: The WIBU licenses do not appear in the license view of the *ibaManagementStudio* web client and WIBU licenses are centrally managed on a license server.

Solution: Open CodeMeter WebAdmin, e.g. via the icon in the system tray of the taskbar, and go to the license access permissions (via *Configuration – Server – License Access Permissions – Mode Advanced*). Check here whether access is permitted for the *local host* in the *Global access rules* and any *Specific access rules*.

ibaManagementStudio can only display the licenses if Localhost has access permissions.

Updates via *iba* cloud installer repository not possible

Problem: You do not receive any update files via the *iba* cloud installer repository.

Solution:

- Check whether you have agreed to the terms of use for Internet access in *ibaManagementStudio* Server Status.
- If strict firewall rules are used, the following hosts must be allowed:
 - <https://cognito-idp.eu-central-1.amazonaws.com>
 - <https://cognito-identity.eu-central-1.amazonaws.com>
 - <https://iba-central-installer-repository-bucket-prod.s3.eu-central-1.amazonaws.com>
- See also ➤ *Connectivity problems when using Proxy*, page 73.

Connection to WIBU gateway not possible

Problem: *ibaManagementStudio* Server cannot establish a connection to the WIBU gateway.

Solution:

- Check whether you have agreed to the terms of use for Internet access in *ibaManagementStudio* Server Status.
- If strict firewall rules are used, the following host and port must be allowed:
<http://licensegw.iba-ag.com/> using Port 443
- See also ↗ *Connectivity problems when using Proxy* , page 73.

Connectivity problems when using Proxy

Problem: *ibaManagementStudio* Server cannot establish a connection to WIBU Gateway or iba Cloud Service.

Solution:

- Check whether the required addresses are allowed through the proxy, see ↗ *Updates via iba cloud installer repository not possible*, page 72 and ↗ *Connection to WIBU gateway not possible*, page 73.
- *ibaManagementStudio* Server uses WinHTTP for communication, but the proxy on the server system running *ibaManagementStudio* Server is not configured for WinHTTP.

Run the following command in the command line:

```
netsh winhttp set proxy proxy.company.com:8080
```

(Replace "proxy.company.com:8080" with the actual local proxy settings.)

Then restart the *ibaManagementStudio* Server service to apply the changes.

Check whether outbound communication is now possible.

- If a connection is still not possible, explicitly set the environment variables.

Run the following commands in the command prompt:

```
setx HTTP_PROXY http://proxy.company.com:8080 /M
```

```
setx HTTPS_PROXY http://proxy.company.com:8080 /M
```

(Replace "proxy.company.com:8080" with the actual local proxy settings.)

11 Support and contact

Support

Phone: +49 911 97282-14
Email: support@iba-ag.com

Note

If you need support for software products, please state the number of the license container. For hardware products, please have the serial number of the device ready.
